- Aortic Dissec^{n}

PULSE

(I) Pulse Rate

(N) 60 - 100/min

Ab (N)

1) **Bradycardia** - <60/min.

Causes

Physiological

1) Elderly
(age related SA node degeneration)

2) Sleep
(↓ in sympathetic activity)

3) Athletes
(Basal ↑ in vagal D/c)

(N) Thyroid hormone
↑ No. + ↑ func° of β_1 receptors

To perfuse brain systemic BP ↑ → stimulate baro receptors in carotid → release ↓ vagal D/c

Pathological

I) **CVS Cause**

1a) Brady arrhythmias
(AV Block)

2) MI [inf. wall]

SA node also supplied by (R) coronary artery

due to stimulation of vagal n/v nearby

II **Non-CVS Causes**

1) Hypothyroidism

2) Hypothermia
(directly affects SA Node)

3) Drugs
a) β blocker
b) non DHP CCB [cause AV Block]
c) ~~Digoxin~~ Digoxin effect

4) ↑ ICP
Cushing's reflex = BP ↑, HR ↓, irregular resp

↑ Bile ⇒ ⊖ SA node

⑤ Obstructive jaundice

2) **Tachycardia** > 100/min

CAUSES

Physiological

1) Infants (↑ SA node activity)

2) Anxiety (↑ sympathetic activity)

3) Exercise (↑ demand)

Sympathetic system ← Thoracic n/vs [thoracolumbar]

Pathological

I CVS Causes

1) Tachy ~~arrhythmias~~ arrythmias.

a) PSVT

b) AF

2) MI (ant. wall) [stimulation of nearby sympathetic n/vs]

II Non-CVS causes.

1) Hyperthyroidism.

2) Fever. 3) Beri-Beri

4) Drugs

a) β agonist

b) short acting DHPs [reflex tachycardia due to compensation]

c) Digoxin toxicity

d) Theophyllin

e) Thyroxin.

③ **Relative Bradycardia / FAGET'S SIGN** Q,

HR doesn't ↑ in proportion to body temperature.

(N) For every 1°c from 37°c.

↓

HR ↑ by 15-20/min from baseline

For every 1°F from 98°F → HR ↑ by 10/min.

e.g. if Body Temp is 40°c. HR = 112/min (baseline = 80/min)

min expected HR = 80 + 45

= 125.

CAUSES

Infectious
(also ⊖SA node)

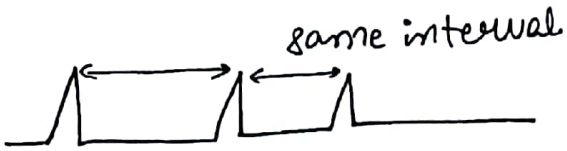
1) Typhoid fever
2) Brucella
3) Legionalla
   (Sputum AFB +ve)
4) Viral

Non-Infectious

1) Drug induced fever
2) Self induced fever or Factitous Fever. Q.
3) Fraudulent Fever
   (thermometer only).

(II) Rhythm :-

(N) → Regular = Fixed interval b/w any 2 consecutive pulses



Ab (N)

Physiological

Pathological.

Sinus arrhythmia

HR changes ↕ inspiration & Expiration.

During Inspiratory Phase

(-ve) Intrathoracic Pressure

↓

↑ Blood flow into (R) side of heart

Baroreceptor ⊕↑

↓

Vagal ↑

↓

HR ↓

Pathological

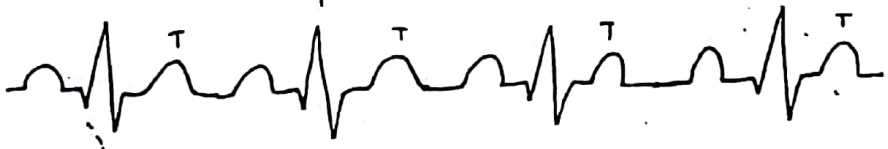
I) Regularly irregular rhythm

↓ predictable ↓ variable.

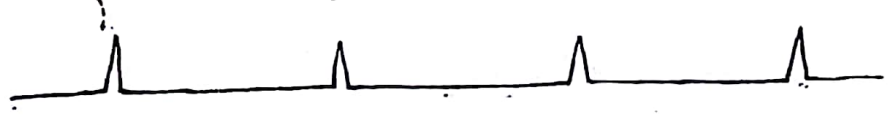
CAUSE :- 1) Bigeminy rhythm ← Digoxin Toxicity

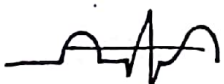
every alternate ventricle contrac° + depolarisate is due to premature ventricle ectopic

Ⓝ ECG.



Pulse





Bigeny 

premature ventricular ectopic [hide p. QRS prolonged, inverted T. due to abnormal depolarization]

Pulsus Bigeminus 
↑ due to ectopic.

↓ amplitude due to ↓ ventricle filling time hence ↓ stroke volume

II Irregularly Irregular rhythm

↓ no predictable ↓ variation in intervals.

CAUSE = Atrial fibrillation. ∴ variable HR

(III) PULSE PRESSURE.

How well a pulse is felt

(N) : SBP - DBP [30 - 60 mm Hg].

AB (N)

I) ↓ PP. / Thready Pulse.

Mech. if SBP ↓ & DBP ↑

if CO ↓.

↓

Stimulate sympathetic activity

↓

arteriolar constrictⁿ → PVR ↑

CAUSE = Shock [Hypovolemic, Shock].
not found in septic or neurogenic shock.

II) ↑ PP / Bounding Pulse.

Mech - if SBP ↑ or DBP ↓

occur. if COT

to ↓ LV strain ⟶ PVR ↓

CO is inversely related to PVR

CAUSE : 1) **↑ CO state**

CVS

1) AR
2) MR.
3) PDA

Non- CVS

Physiological → ♀ when plasma vol ↑.

Pathological →

1) Hyperthyroidism

β_1 rec ⊕

ionotropic ⇓ ↑SV

chronotropic ⇓ HR ↑

COTT = ↑SV X HR ↑

2) Anaemia
3) Beri- Beri

Ⓝ vit B_1 ⊖ NO synthase

if Def of Vit B_1
↳ vasodilatation
↓ PVR ↓ → COT

PVR ↓ as arteriole are bypased
↳ COT

4) A-V fistula

5) Paget's Disease
[A-V fistula in Bone]

Q. ⊆ low CO state will cause bounding Pulse ?

Ans. severe bradycardia ⊆ complete AV Block

SV ↑ × HR ↓↓ → CO ↓

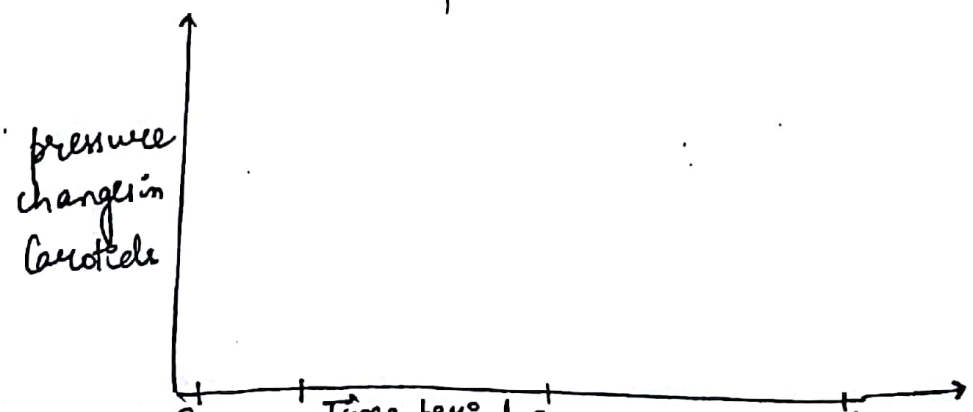
AV Block → ↓ depolarisation of ~~purkinje~~ purkinjee fibres
↓
rate is ↓ [firing speed is less in AVN]
↓
But EDV ↑
↓
SV ↑

(W) CHARACTER

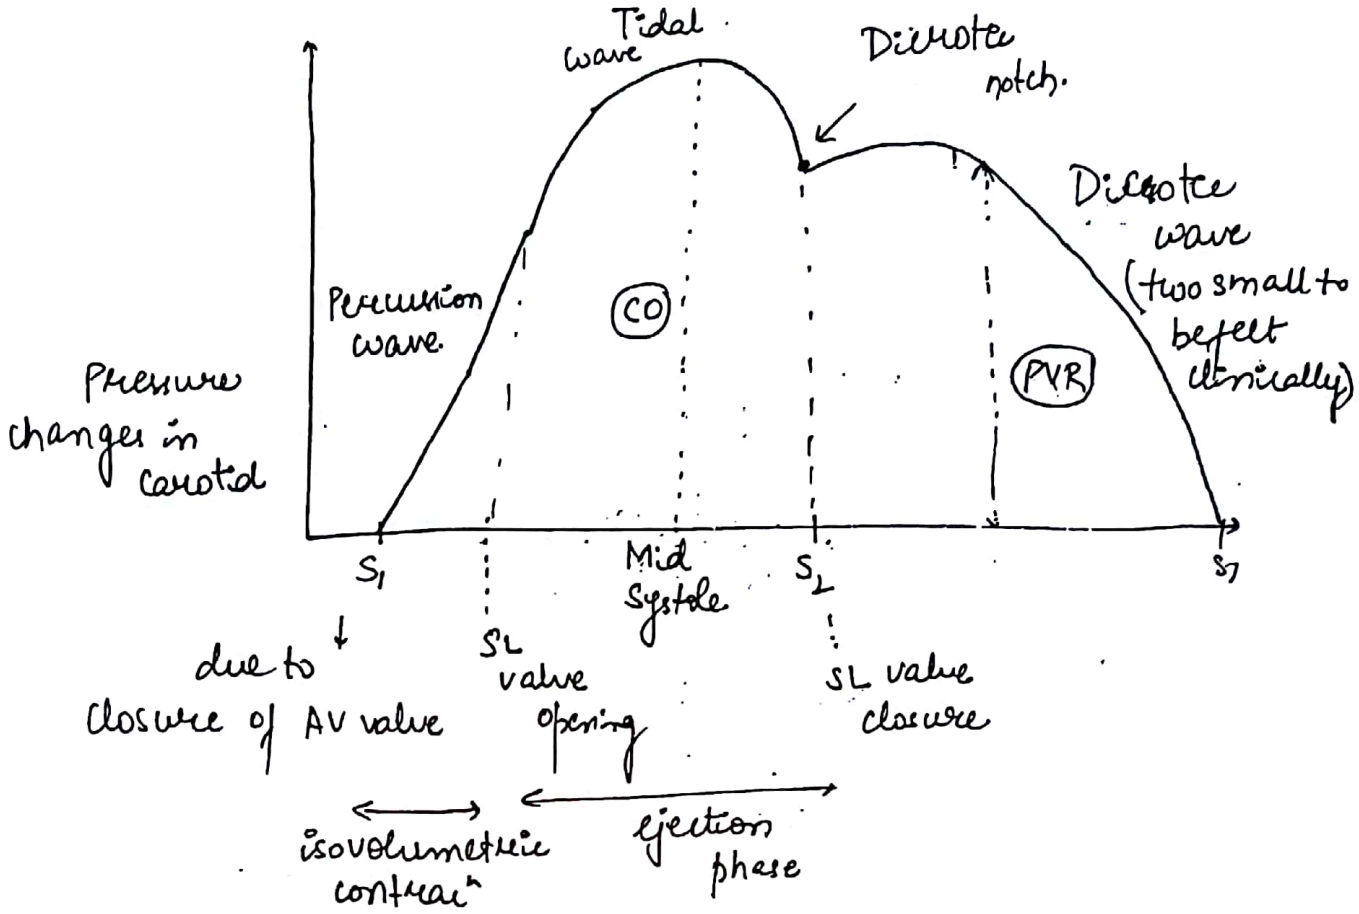
Rate Rhythm best anised in Radial artery

Character /contour " " " Carotid artery

(N) waveforms of carotid.

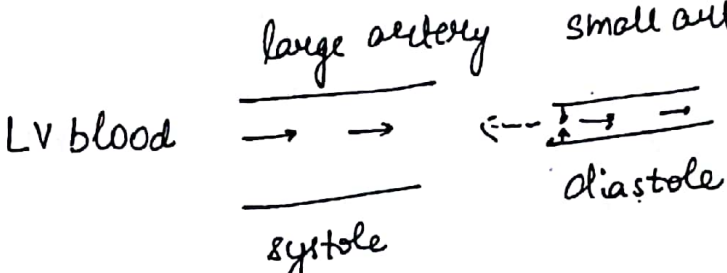


S_1 is due to closure of AV valves



WAVE	MECH
① Percussion wave	It is due to pressure transmission by isovolumetric LV contrac" onto carotids
② Tidal wave	Beginning of blood ejec" into carotid ↑ing its pressure further.
③ Dicrotic wave	Due to back pressure reflection from small vessels

Dicrotic notch represents closure of aorta & pulmonary valve (S_2)

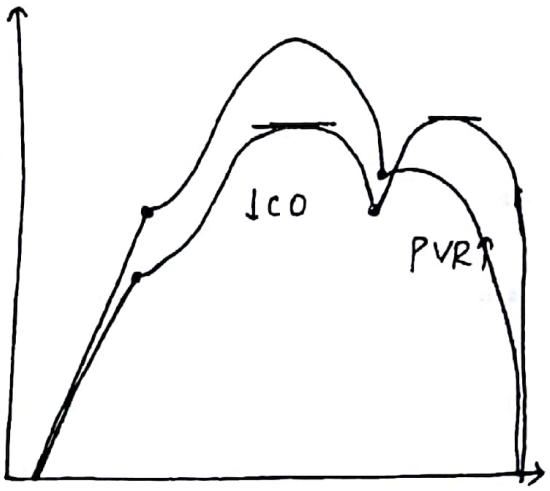


Recoil of small vessel lead to +ve pressure impulse

Ab (N)	Diagram	Cause
1) Hyperkinetic Pulse ⇒ ↑ amplitude		↑ CO state
2) Hypokinetic Pulse ⇒ ↓ amplitude	though dicrotic wave in ① but still not felt not felt clinically.	↓ CO state
3) ↓ amplitude = Parvus Late peak = et tardus		most specific pulse of severe AS.

④ Dicrotic Pulse

= 2 peaks
one in systole
other in diastole



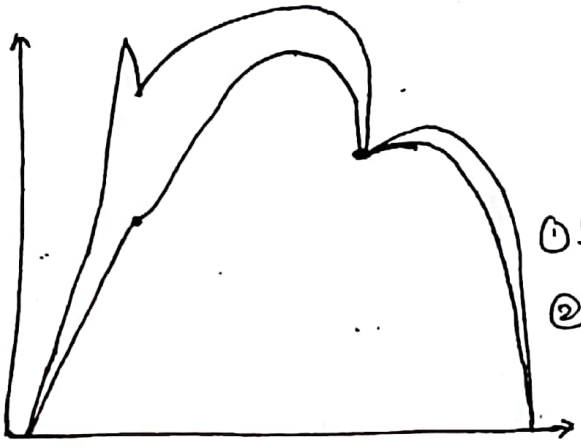
Dicrotic pulse is felt.

Shock
(Hypovolemic
Cardiogenic)

⑤ Bifferiens Pulse

= 2 peaks
(B) in systole

Best assessed in
Peripheral artery



Most specific pulse
of
① Severe AR.
② Severe AR + AS

Brisk isovolumetric (L) ventricular contraction.
(↑ LV vol. + ↑ stretching)
↓
Percussion wave will shift to (L) (as duration is less)
↓
gets separated from tidal wave

It will make tidal wave to come late.

③ HOCM ---?

V MISCELLANEOUS POINTS IN PULSE.

1) PULSUS ALTERNANS - Best assessed in Radial.
Regular alteration of pulse amplitude.

only amplitude changes, interval remain same

CAUSE → LV (Systolic) Dysfunc^{n}. ← most specific pulse.

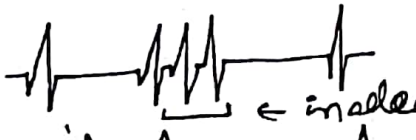
2) PULCE DEFICIT :-

(N) HR - PR ← due to adequate SV = 0
↳ arterial pulsation is felt
↓
due to ventricle contract

Ab (N) if HR - PR = (+ve) ⇒ PULSE DEFICIT.

CAUSES

1) AF ∴ variable heart rate



← inadequate ventricular filling ⇒ No pulse

Pulse ↑ adequate ventricle filling

Here 5 HR but 3 PR

2) Premature Ventricle Ectopics
less filling time → pulse not felt

If pulse Deficit > +10/min ⇒ AF only

3) PULSUS PARADOXUSES :-

(N) SBP_{exp} & SBP_{insp} = 0 to 10 mm Hg.

If this difference is > +10 ⇒ Pulsus Paradoxus.

Exaggeration of Normal Phenomenon. hence paradoxical word is wrong.

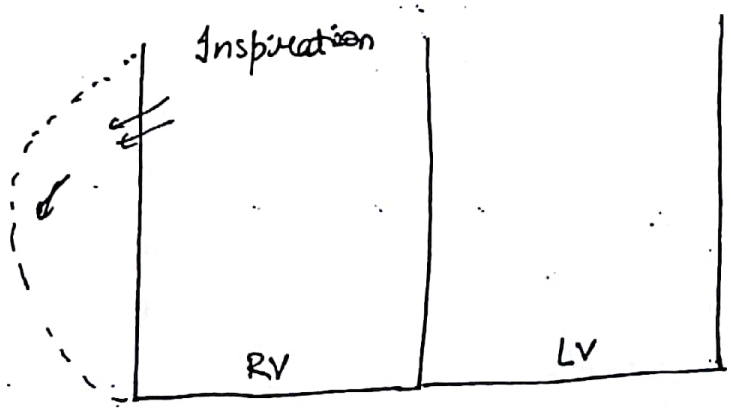
Mech ↓ in SBP_{insp} more than physio limits.

CAUSES

(I) CVS :- 1) H/c CVS cause = Cardiac Tamponade.

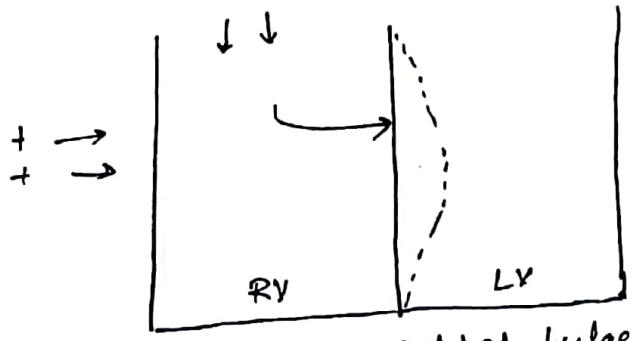
"Compression" of heart due to pericardial effusion.

(N) During Inspiration,
Blood flow is more in (R) ventricles
↓
RV wall dilates to accomodate extra blood.



In Tamponade.

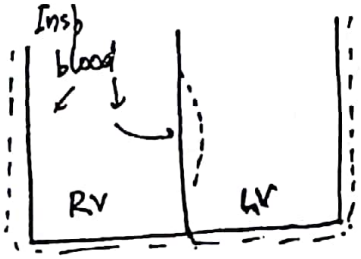
Inspiration
blood.



RV wall can't dilate due to ~~pleural~~ pericardial fluid. → septal bulge in LV → ↓ LV filling further → ↓ CO (↓) → SBP (↓) during inspiration than physiological limits.

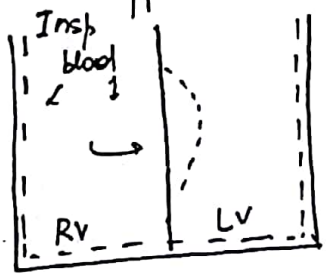
2) Constrictive Pericarditis

Failure of relaxation of heart due to stiff pericardium



3) Restrictive Cardiomyopathy

Failure of relaxation of heart due to stiff endomyocardium.



Septum should be spared from stiffness to cause this ~~side~~ sign

II) Non CVS Cause

H/c overall cause → 1) Acute Exacerbation of Asthma or COPD.

2) Pulmonary embolism
3) Kussmaul breathing [due to met-acidosis]
4) Obesity
5) SVC Obstruction [reason not known].

Deep Inspiratory efforts.

↓ Large -ve intrathoracic pressure

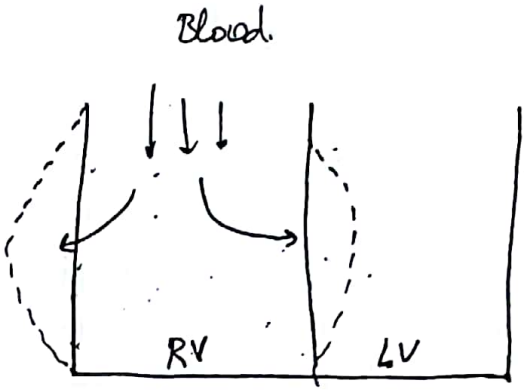
↑↑↑ venous return to the right side

↓

Septal bulge.

↓

Pulsus Paradoxus



Due to extra blood septal bulge occurs.

JVP

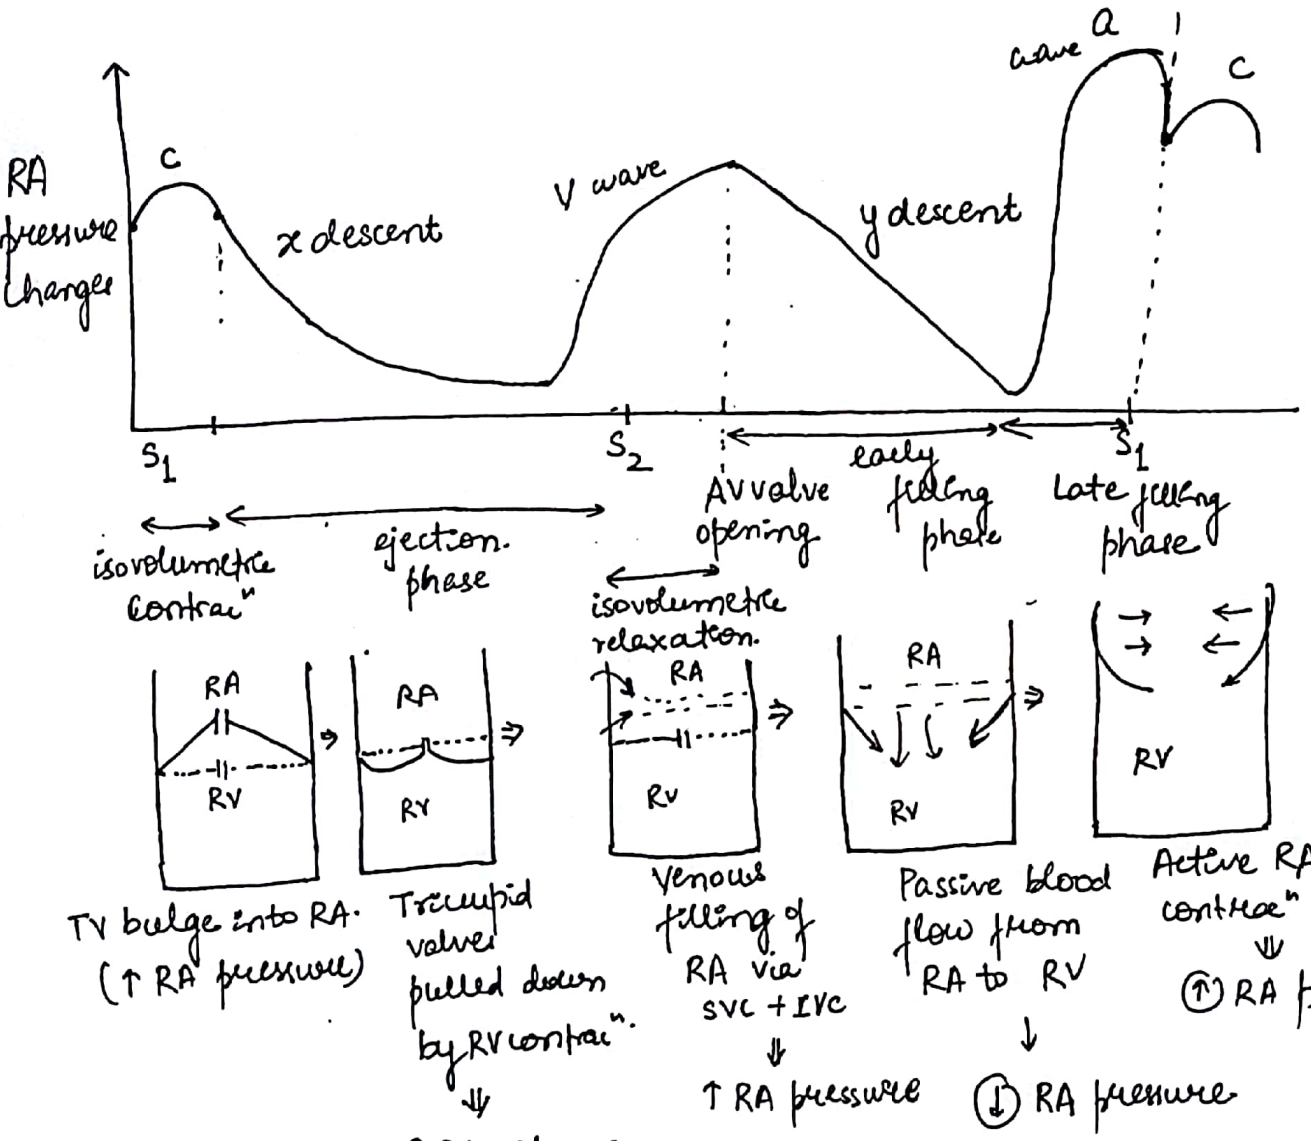
(N) - measure of (R) atrial pressure seen in (R) IJV

(N) Height → 0-3cm from sternal angle

↓ 5cm below

RA activity.

= 5-8cm from RV activity.



Q ∠ wave ; (B) syst + diastolic

⇒ V wave

Q. ∠ wave will be more prominent?

⇒ a wave.

Q. ∠ descent will be more prominent?

⇒ x ~~wave~~ descent

Ab (N) JVP

(I) **a wave** = due to (R) atrial contraction

1> **Absent a wave** = if ineffective atrial contraction

↓

AF

2> **Large a wave** = if (R) atria contracting against more resistance

(Diastolic wave)

If (R) atria is contracting → 1) Tricuspid valve gives resistance
2) RV also gives resistance

cause-

a> **Tricuspid stenosis**

b> RV pressure ↑

- ↓ RVH (concentric) ↑ due to (PS) → **PAH**
- ↓ RV failure (systolic) → RV blood retention. ↑
  1) Pulmonary embolism
  2) RV ~~ex~~ MI
  3)
- ↓ "Compression of RV" ↓ **Cardiac Tamponad**

5> **Canon a wave** = if RA contracting against closed T. valve.
(Systolic event)

occur if RA & RV are contracting simultaneously → cause TV closure

causes → ① **Junctional rhythm.**

SA node arrest → AV node becomes pacemaker & impulse reach (B) atria & ventricle simultaneously

Rate of cannon a wave = 50/min, **Regular**

② **Complete AV Block**

SA node will depolarise atria.
Purkinje fibres will depolarise ventricle independently.

So occasionally atria & ventricle can depolarise simultaneously

Canon a wave is = **intermittent**

(II) X Descent

(N) due to tricuspid ring pulled down by RV contrac. during ejec. phase.

+

(R) atria is free of significant blood (during this phase)

Ab (N)

1> Absent x Descent

if (R) atrial pressure doesn't fall as it contains

significant Blood or Clot

Significant blood → TR

Clot → AF

② Deep x Descent

occur if tricuspid ring pulled more downward due to

↑

» Increased RV contract

(?) 1) Cardiac tamponade

2) Constrictive Pericarditis.

III V Wave

(N) due to venous filling of (R) atrea

Ab(N)

1) Absent or Low V wave :-

occur if venous filling of RA (↓)

cause - a) obstruc" SVC

2) Large V wave :-

If RA pressure ↑ during venous filling

↓

if venous filling ↑

SVC → IVC → RV ↑ TR

or ↓ compliance of (E) atrea

[failure of relaxation]

1) constrictive pericarditis

2) Restrictive cardiomyopathy

(IV) Y Descent

(N) due to passive blood flow from (R) atrea to (R) ventricle ab(N)

1) **Rapid Y Descent** :- / FREIDRICH'S SIGN.
Will occur if (R) atrial blood moves very fast into (R) ventricle as soon as Tricuspid valve opens.

All causes of large v = Rapid y

2) **Slow y Descent** :-
If (R) atrial blood moves into (R) ventricle slowly.

cause - 1) Tricuspid stenosis
2) ↑ RV pressure

Causes of Large a = Slow y

y descent absent - if RA blood doesn't move into RV during passive filling phase

↑

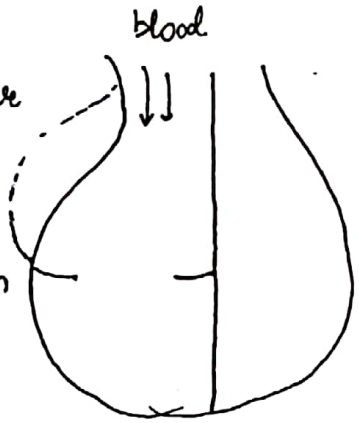
occurs if (R) ventricle is fully "compressed"

⇕

Cardiac Tamponade.

Signs of JVP	Description	Causes
① Abdomino Jugular reflex [abdomen compressed for 30 sec]	if JVP remain elevated by more than 3cm even after release of compression for >15 sec	Latent RVF. / no RVF in basal state + RVF is manifested if RV workload ↑
② Kaussmaul's sign	↑ in JVP during inspiratory phase [Ⓝ JVP ↓ during inspiration]	if Ⓡ atria fail to relax Ⓝ ↓ Constrictive pericarditis Restrictive cardiomyopathy

RA relaxes further
[RA Ⓟ doesn't ↑]
+
Diaphragm goes down
⇓
Ⓡ atria goes down
↓
JVP falls



If basal RA Ⓟ if = TS RVF

Basal atrial 'P' ↑ due to
↙ if AV valve Stenosis
↘ ventricle failure

Kussmaul's sign is absent in tamponade. --- ?

Q. Δ of etiology :-

Ⓝ

Junctional rhythm

APEX BEAT

(N). due to isovolumetric (L) ventricular contrac^{n}.

⇓

LV apex displaced superiorly

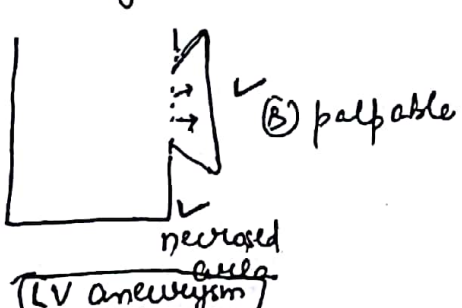
Nature → Tapping.

Site → (L) 5th ICS; just medial to mid-clavicular line

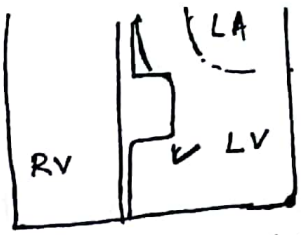
Area → < 2.5 cm^2 [localised].

Ab (N) of Apex

Ab(N)	Description	Cause
(1) Hyperdynamic	Palpable for upto $\frac{2}{3}^{rd}$ of systole	(L) ventricular volume overload. [↑ CO state]
(2) Sustained	Palpable for > $\frac{2}{3}^{rd}$ of systole	(L) ventricle pressure overload. eg. AS.
(3) Diffuse	area > 2.5 cm^2	Dilated cardiomyopathy
(4) Double	2 impulses palpable in systole	LV aneurysm (complication of MI)



Asymmetrical Septal hypetrophy



= HOCM / Subvalvular Aortic Stenosis

If hypertrophy is anterior then palpable

↳ it obstruct LV outflow

⑤ Triple — 3 impulses palpable in systole

HOCM.

⑥ Absent — non-palpable

Pericardial effusion
Emphysema
Obesity
Dextrocardia Q
↳ apex goes posteriorly hence not palpable

Q. Double Apex seen in

~~① AS~~ [HOCM is subvalvular AS]

② TS

③ MS

④ AR.

AUSCULTATORY FINDINGS

* S_1.

due to closure of AV valve.

(N) = $M_1 T_1$ [mainly contributed by mitral valve].

Split < 20msec.

Site : Apex

* Pitch : moderate

Any mitral valve sound/ murmur.
Best area = Apex

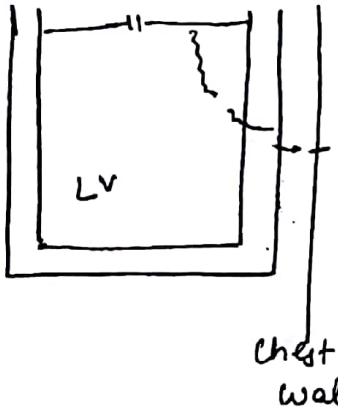
Ab(N)

Factors affecting the intensity	soft S_1	Loud S_1
1) Force of isovolumetric ventricle contraction	if weak force ↑ eg. Dilated CMP, LVF, RVF, VSD &	Strong force eg MS, TS (if atrial (P) is high)
2) Cond^n of A-V leaflets	if fail to strecke each other eg. MR, TR, calification of leaflet	–

3) The presence of fluid, mls air fat between AV leaflet & stethoscope

- if ventricle blood vol. ↑
  - AR
  - PR
- if ventricle wall thickness ↑
  - LVH ← AS
  - RVH ← PS

thin, lean.

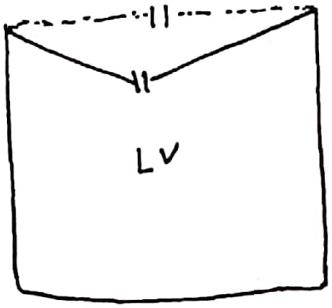


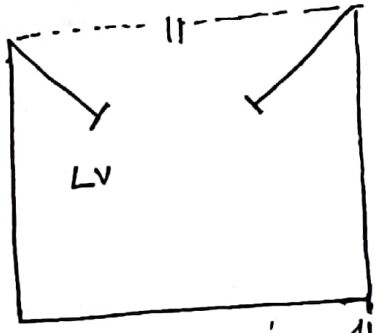
LMR

All valvular Lesions cause Soft S_1 except MS . TS

4) Most imp factor

Position of AV leaflets at onset of ventricle contrac^n.





If impulse reaches ventricle late + ventricular blood filling fully complete

↓

AV leaflets pushed to close position.

- Bradycardia
- PR interval ↑

If impulse reaches ventricle fast + ventricle blood filling incomplete

↓

AV leaflets fully open.

Tachycardia

Short PR interval

Q. In Hypothyeroidism, S_1 is soft-

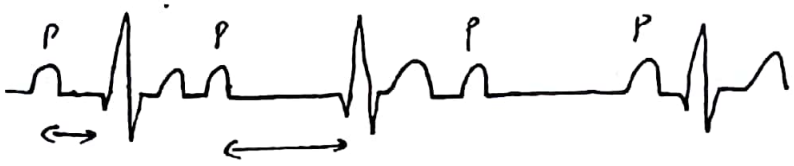
Q. In Digoxin effect, S_1 is soft ans AV Block → PR ↑ interval

Q Cond^n causing variable S_1 intensity :-

If variable HR = AF

Q If variable PR interval = 2° AV Block

→ Mobitz -I. Q.Q.



Progressively PR interval ↑ till atrial impulse fails to conduct to ventricle

= Wenkebach's phenomenon.

* S_2

It is due to closure of Semilunar Valves.

(N) - A_2 P_2

Aortic valve closes earlier than Pulmonary valve

↓

LV ejec^n time is less than RV

Site = For A_2 — aortic area — (R) 2nd ICS

For P_2 — Pulmonary area — (L) 2nd ICS

Best for S_2 → Pulmonary area. [as both sound heard]

Split = 30-60msec.

During Inspiration → split Increase

LV blood vol ↓
LV ejec" time ↓
A_2 early

RV blood vol ↑
RV ejec" time ↑
P_2 → Late

During Expiration → split Decreases. or Expired

LV blood vol. ↑
A_2 late.

RV blood vol ↓
P_2 early

Ab (N) of S_2 split

1. **Wide split**

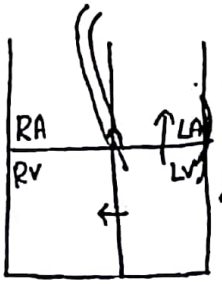
CAUSES

I) **Early A_2.** (earlier than physio limit)

↓ If LV ejec" time ↓
- VSD
- MR

or

↓ If LV early depolarisation.



accessory pathway from LA to LV will depolarise LV early.
(Bundle of Kent)

- WPW Syndrome
- M/cSite → (L) Q.

→ Type A WPW syndrome

WPW SYNDROME

1) ♂ > ♀
2) (L) side more common
3) short PR interval
4) S_1 will be Soft Q. ... ?

II) P_2 is Late [Later than physio Limit]

RV ejec" time ↑ or RV late depolarisation

eg PS
RVF

eg. RBBB

(2) REVERSE SPLIT or PARADOXICAL SPLIT

P_2 A_2.

CAUSES

(I) P_2 is early (earlier than A_2)

RV ejec" time ↓ or RV early depolarisation.

- TR
- VSD ± R to L shunt
  (Eisenmenger Syndrome)

WPW type (B)

(II) **A_2 is Late** (later than P_2)

- LV ejec" time ↑
  - AS
  - LVF
- LV Late depolarisation
  - LBBB

Q. How to differentiate bet" Split & Reverse Split.

During Inspiration.

Reverse split will Decrease RV vol ↑

LV vol ↓

Split Decrease [against (N) rule].

During Expiration

Rever split will Increase

RV vol ↓

LV vol ↑

Split Increase

Q. In. Pulmonary artery HTN, S_2 Split

(a) (I)

(b) ↑

(c) No change

→ P_2 comes early ----?

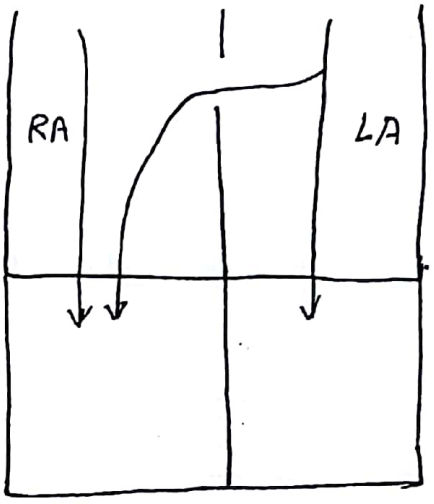
Hint - Pulmonary hang out interval

(3) WIDE + FIXED SPLIT

doesn't vary ∵ resp. phases.

cause → ASD.

RV blood ↑ → P_2 late
LV blood ↓ → A_2 early
} Wide



Split is fixed
= ventricle blood vol remain constant during Insp. + Exp.

⇓

RV blood → Insp. = ↑ + ↓
→ Exp. = ↓ + ↑
⇒ Fixed.

Intensity of S_2

Factors	Soft	Loud
1) Pressure of aorta/ Pulmonary to close SL valves.	Hypotension	Systemic HTN → A_2 P. HTN → P_2
2) Cond^n of SL valves Leaflets.	calcified AR PR	x

* Single S_2 seen in - AR [A_2 is absent]
PR [P_2 absent]
AS/PS [valves get severely calcified]

S_3 / Ventricle Gallop

It is due to ↑ in ventricle blood volume during early filling phase.

↓

ventricle vibrations

Causes:-

Systolic dysfunc^n [↑ end systolic volume]

↓

(L) VF.
RVF
DCMP
MI
LV aneurysm

Site → LV S_3 → Apex
RV S_3 → Tricuspid area. [(L) lower parasternal]

Pitch → Low pitch.

Atrial venous filling ↑

↓ early filling phase

↑ blood will enter ventricles from atria

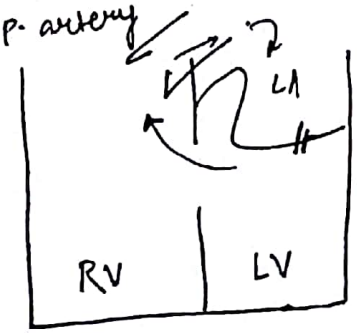
↓

eg. high CO state
MR . TR

Q. In atrial septal defect ⊆ side S_3 → RV S_3 / LV S_3 ?

ans → RV S_3.

Q. In VSD, ⊆ side S_3 = LV S_3



Pulmonary valve is open in systole so blood from VSD goes into

P. artery

↓

P. vein

↓

(L) atrium

MV is closed in systole & blood is collected in it
1st chamber to enlarge is (L) atria.

Q. In PDA ⊆ side S_3 = LVS_3

S_4 / Atrial Gallop

It is due to atria contracting against stiff ventricles → ventricle vibrate

Causes-

1) Restrictive CMP
2) HOCM
3) LVH due to AS
4) RVH due to PS
5) Acute MI.

In acute MI Both S_3 & S_4.

↓ relaxation
↑
↓ ATP due to ischaemia.

Site- LVS_4 → Apex
RVS_4 → Tricuspid area

Pitch - Low pitch.

Q. S_3 can be physiological (= True) / False

Ans → ♀ . young children & athletes

Q. S_4 can be physio - True (False)

Q. S_3 represents systolic failure

Q. S_4 represents Diastolic failure

Q. S_4 seen in all except

a) AS [LVH]

b) Constrictive Pericarditis [ventricles are trapped → can't vibrate]

c) AR → extreme (L) ventricle dilatation → making it stiff

d) Amyloidosis [RCMP]

Constrictive Pericarditis doesn't produce S_3 & S_4.

ADDITIONAL HEART SOUNDS

MURMURS

Due to turbulence of blood flow ~~in the~~

If ab Ⓝ ↑ pressure gradient during normal direc^n of blood flow

↓

due to stenotic Lesions

If ab Ⓝ direc^n of blood flow

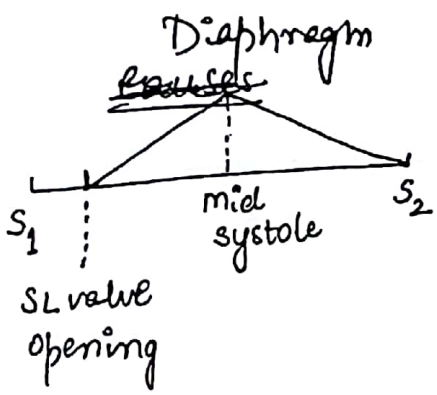
↓

due to Regurgitant Lesions or VSD

TYPES

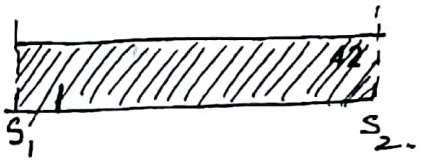
(I) SYSTOLIC MURMURS

Name	M/c murmur overall	Causes
① Ejection systolic murmur or Mid-systolic murmur or crescendo-Decrescendo	due to turbulence of blood flow due to ejection phase	AS, PS ↑CO states. → [⊙]. (↑ blood flow across SL valves)



② Pansystolic Murmur
No peak.

VSD
[LV pressure remain > RVP throughout systole]



chr MR
[LV 'P' remain > LA 'P' throughout systole]
Chr. TR.

QQ.
③ Early systolic murmur

If defect closes before mid-systole
eg. Small muscular VSD

or

If pressure gradient becomes zero (≤ mid-systole)
ⓑ Acute MR.
[MI or IE].

LA is not dilated unlike chr. MR.

During early systole, Ⓛ ventricle blood enters LA
⇓
LA 'P' will ↑ rapidly
⇓
during mid systole Ⓛ atrial 'P' = Ⓛ ventricle 'P'
⇓
murmur will stop

ⓒ Acute TR.

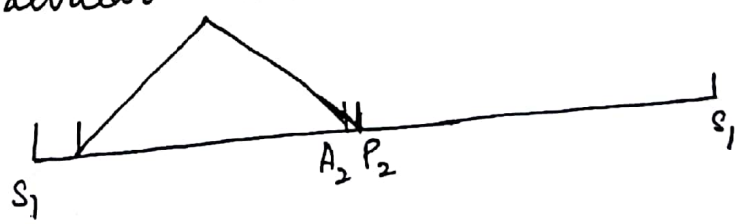
④ Late systolic murmur

MV Prolapse

(II) DIASTOLIC MURMURS

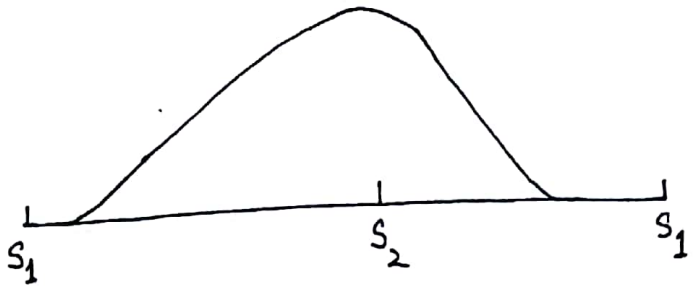
Name	Causes	Diagram
1) Early Diastolic murmur. or Decrescendo Murmur	AR, PR	
2) Mid-Diastolic murmur	Turbulence of blood flow from atria to ventricles. MS, TS	
Q. Early Systolic murmur seen in all except
a) TR (acute)
b) VSD (small muscular)
c) papillary m/s necrosis (MI → acute MR)
d) AS

Q. Identify the valvular lesion



a) MS
b) TS
c) PS
d) PS

(III) CONTINUOUS MURMUR



- Starts in systole
- Peaks around S_2
- Ends in Diastole

Origin - single site

Mechanisms :-

If Ab (N) pressure gradient is maintained throughout systole & Diastole

&

If Defect remains open throughout Systole & Diastole

Continuous murmurs are never due to valvular Lesions

CAUSES :-

1) Ab (N) communication b/w artery to vein

eg : A-V fistula

Ruptured sinus of valsalva (aorta to (R) atria connection)

2) Ab (N) communication b/w systemic to Pulm.

eg. PDA

(3) ↑ blood flow into blood vessels
mammary artery souffle (lactation)
uterine artery souffle. (♀)

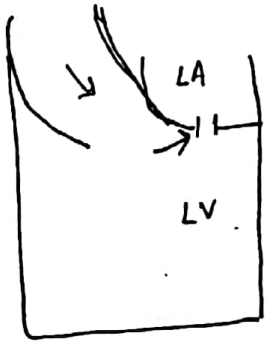
(4) Severe arterial stenosis [>70% narrowing of diameter]
Renal artery stenosis → 'bruit'

Q. Continuous murmur can be physiological - True/false
↳ ♀, Lactation

Q. All causes continuous murmur except
a) Pt. of CKD on heamodialysis [A-V fistula]
b) Severe atherosclerosis [carotid or renal artery stenosis]
c) AR + AS
d) Lactation.

D/D of Continuous Murmur.

	Continuous murmur ✓	To & Fro ✓	Systolic-diastolic ✓
Systole + Diastole			
Origin	single site	single site	Different sites
Peak around S_2	✓	×	×
Eg.	✓	AS + AR 	AS + MS 
Name	Cause	Type	Site
1) Gibson's murmur	PDA	continuous	(L) upper parasternal area
2) Key Hodgkin's murmur	AR	early diastolic	(L) 3rd ICS = Erb's area = Neo-aortic area
3) Graham-Steel's murmur	PR	early diastolic	(L) 2nd ICS Pulmonary area
4) Austin flint murmur	AR Regurgitant jet of AR striking mitral valve.	mid-diastolic to late	Apex
5) Carey Coomb's murmur	ARF Turbulence of blood flow over inflammed rough mitral valve	mid-diastolic murmur.	Apex
6) Dock's murmur	Severe stenosis of LAD artery (widow's artery)	continuous murmur.	3rd (L) ICS 4cm from sternal margin



⑦ Still's murmur — young children — Ejection systolic murmur — Pulmonary area

- Innocent murmur

(Relatively ↑ blood flow across Pulm. valve)

⑧ Rytand's murmur — complete AV Block. ⇓ ↑ Blood flow across AV valve — mid-diastolic — apex.

FACTORS AFFECTING MURMURS:-

If blood flow ↑ → all murmur will ↑ **except** ⇓ MVP, HOCM.

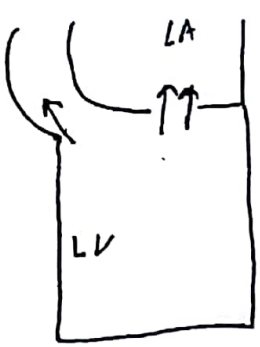
	Blood flow	Murmur
1) Respiratory variation.		
a) Inspiration	↑ blood on ® side	↑ TS, TR, PS, PR exception Pulmonary ejection click ↓ in inspiration
b) Expiration	↑ blood on Ⓛ side	↑ MS, MR, AS, AR [except HOCM, MVP]
c) Valsalva effect (Persistent expiration)	~~Persistent expiratory~~ ↓ blood on ® side followed by Ⓛ side.	All murmur will ↓ [except HOCM, MVP].

II Postural :- Valiation

a) Standing	↓ blood flow into R+L side	all murmur will ↓ except HOCM, MVP
b) squatting (immediate effect)	↑ blood flow into R+L side	all murmur will ↑ except HOCM, MVP

III Effects of Afterload changes :-

Lesion	Afterload ↓ (aorta 'P' ↓)	Afterload ↑ (aorta 'P' ↑)
AS	murmur ↑	murmur ↓
Pressure gradient = LV 'P' - aorta 'P'		
AR	murmur ↓	murmur ↑
Pressure gradient = aorta 'P' - LV 'P'		
MR	murmur ↓	murmur ↑



Regurgitant Lesions behave similar

MVP

Cause- Deficiency of type III collagen in MV leaflets (posterior)

⇓

↑ leaflet flexibility

↓

surface area of MV leaflet ↑

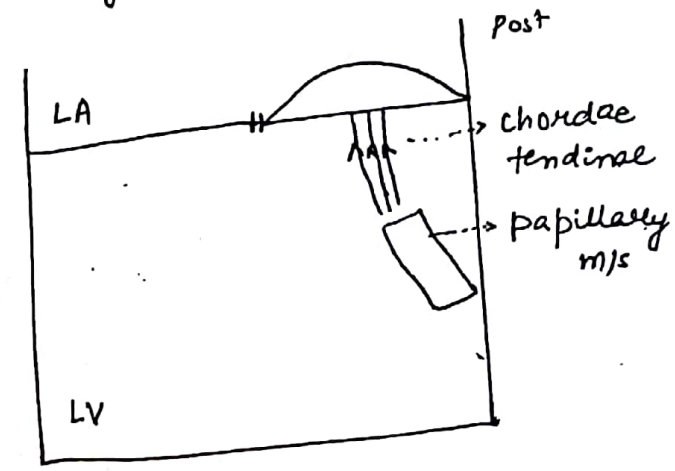
↓

too big for LV cavity

C/F

Symptoms:-

1) chest pain
   M/c symptom
   Due to papillary m/s stretching

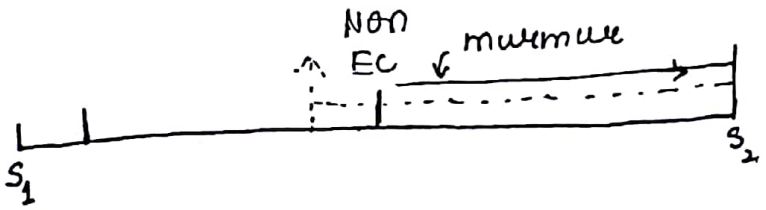


2) Palpitations
   Ventricle fibre stretching
   ↓
   produce ventricle ectopic

Sign:-

▷ M/c sign → **Non-ejection click.**
due to doming of MV
↳ occurs when LV cavity size ↓ significantly

2) Late systolic murmur (MR)
   occur when post. leaflet looses contract & ant. leaflet



If LV cavity blood vol. ↓ → Prolapse will occur early
[standing position
inspiratory phase]

↓

Non-Ejec^n click earlier.

↓

murmur will start earlier

Inv

1) 2D Echo
if prolapse is **> 2mm** into LA

T/t

1) Reassurance. (mostly benign)

2) β blockers (if palpitations) DOC

3) S_x repair ← NYHA symp ≥ II
+
Severe MR on ECHO.

HOCM

Cause - AD
mutation of β-myosin heavy chain.
["Private mutations"]
⇓
Assymetrical Proliferation of septum.
near the LV outflow tract
⇓
Free wall hypertrophy

→ Diastolic func' ↓ as filling is impaired

→ LV systolic function ↑ to overcome obstruc"

C/F

Symptom :-

1) Earliest → Dyspnoea ← LA P' ↑ ← LV P' ↑

2) Angina ← ↑ LV workload.
+
Coronary vessels compressed by hypertrophied myocytes

3) Syncope ← Fixed CO [CO will not ↑ during demand]

4) * **Sudden cardiac death**

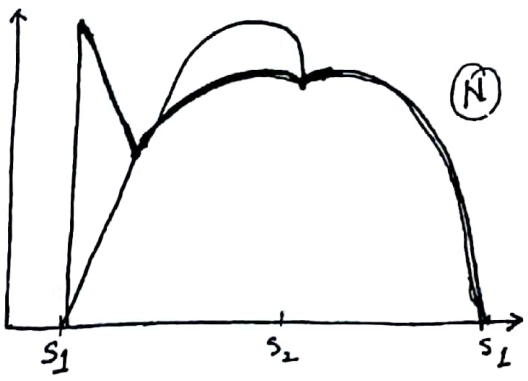
→ Irreversible loss of cardiac func"
c in 1 hour of symptoms

→ HOCM is M/cc.

- SCD is due to ventricular arrhythmias due to ischaemia
↓
Na⁺/K⁺ atpase.

Signs:-

1) Pulse = Bifid
or
Pointed finger pulse



2) JVP :

If hypertrophied septum bulge into (R) atrium

Bernheim's effect → RV 'P' T

- a ↑
- y slow

Systolic func" ↑ - Brisk ventricular contrac" → Percussion wave will be early + Tidal wave low due to obstruc" of blood flow

3) Apex = Double / Triple

4) S_1 = Intensity soft

S_2 = Split Reverse

S_3 = Rare

S_4 = LV S_4 ++

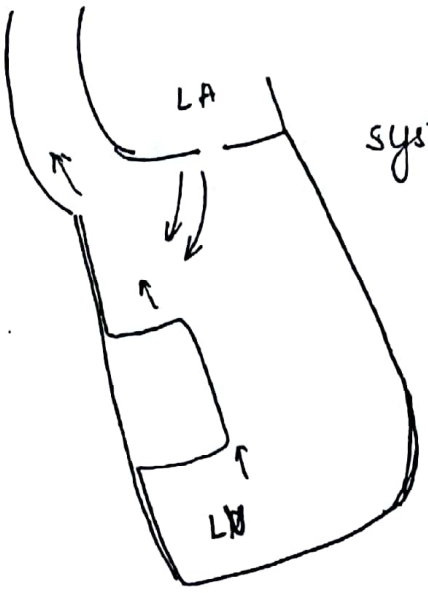
A_2 late ↑ LV ejection time ↑ (due to obstruc")

QQ

5) Most characteristic sign:-

Type → Ejection systolic

Site → (L) 3rd ICS Erb's area



(SAM)
systolic ant. movement of mitral valve towards septum
↓
further ↑ing the obstruc^{n}.

2 most imp factors affecting obstruc^{n}

① Contractility
if ↑ → SAM ↑ → obstruc^{n} ↑

② Blood in LV if ↓ → obstruc^{n} ↑
(preload)
(Blood act as physical barrier separating MV & septum)

Drug
Digoxin. C/I in HOCM.
Diuretics
Veno Dilators

Inv
1) CXR → cardiac size (N)
2) ECG →
(N)

HOCM
QRS amplitude ↑
depth > 10mm
Giant Inverted Twave

3) Echo - $\frac{\text{septum thickness}}{\text{LV free wall thickness}}$ · $\frac{3}{1}$ [reversed from (N)]

Rx

1) β blocker → Initial DOC

If CI → Non DHP CCB.

Doesn't prevent sudden cardiac death.

2) AMIODARONE

given if post H/o ventricle arrhythmia

3) Implantable defibrillator. Device (intracardiac)

↳ prevent SCD

4) Septal artery sclerosis [ethanol]

↓

causes regression of septum.

   Chronic - ⊕ sympathetic system = (↑ BP)

3) CVS events
   a) CAD → ↓ risk by ↑ HDL [French paradox]
   b) stroke → (↑ risk) due to ↑ BP
   c)

4) Arrhythmia
   alcohol binge → (AF) [Holiday Heart Syndrome]

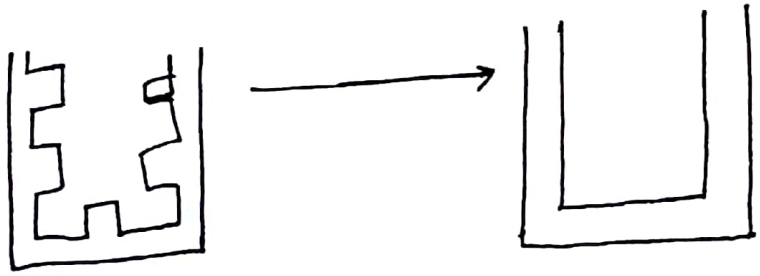
III) Genetic Causes

MOI	Q. Gene/Protein	Unique feature
1) AD	TTN / Titin → sarcomere protein. (N) helps in contrac"	M/c genetic cause of DCMP
2) AR	DSP / Desmoplakin → Desmosome protein (N) helps in synchro. contrac"	Arrhythmogenic RV Dysplasia. (ARVD) → sudden cardiac death in young population.
	NAXOS Disease	- {woolly hairs + thick palmar skin + ARVD}
3) X-R	TAZ / Tafazzin → (N) helps in compaction of ventricle cavity during embryonic development	LV non compaction. * LV thrombus since birth.

(N) V_1 =

ECG. ← epsilon wave.

V_1 -



Embryonic

IV Post Myocarditis

Causes :-

Infectious

1) MC viral - Coxsackie B
other viral infe"
- Parvovirus B19
- HIV
- Hepatitis C

2) Bacterial
M/c - Diphtheria [death is by myocarditis]
R_x - anti-toxin

3) Protozoa
M/c - Trypanosoma Cruzi
[chaga's Disease]
R_x - Benznidazole

4) Parasite
M/c - Trichinella
R_x - albendazole

Non-infectious

1) M/c - Sarcoidosis [lung involves]
M/c site → LV free wall
M/c pattern → DCMP > RCMP
R_x = steroids

2) Giant cell Myocarditis
(no lung involvement)
R_x - steroid.

3) Hypersensitivity Myocarditis
cause - Thiazide
Indomethacin
Methyldopa
R_x - cessation of drug
± steroids

Q V. Tako-Tsubo CMP / BROKEN HEART SYNDROME / APICAL BALOONING SYNDROME

C/F - ♀ + ↑ catecholamine release
⇓
vasoconstrict of LV apex
⇓
LV apex non-contractile
⇓
During systole RV apex bulge out in systole like ballon.

Ix - ECG - ST↑
Troponin = ↑ or Ⓝ
coronary angiography → no thrombus
ECHO - LV apex bulging out in systole.

→ resembles a jar used to trap octopus
⇓
hence called Tako-Tsubo.

Rx - reversible, so supportive therapy
+ α blocker followed by β blocker [like Pheochromocytoma]

VI. Peri-Partum CMP

Mech:- 1) Autoimmune damage to myocyte by foetal Ag.

2) Prolactin fragments → myocyte damage

C/F:- occur in 3rd trimester - 6 months post delivery

Risk ↑ → Twin Delivery
multipara
age > 30 yrs

Rx - 1) Diuretics

2) **Bromocriptine** [by ⊖ Prolactin].

↳ also used in Type 2 DM.

RESTRICTIVE CMP

Pathology :- Infilteration → Fibrosis

(I) Infilteration

A> In between myocytes

eg. Amyloidosis ← M/cc of RCMP

Types	Protein/cause	C/F	Rx
1> 1° amyloidosis	AL / multiple myeloma Waldenstrom macroglobulinemia NHL	Age - >50 yrs M/c organ - Renal M/cc = CVS of death unique - Black or Raccon eyes.	underlying disorder.

Factor Xa adsorb on AL protein leading to ↓ in blood → blood def. of Xa. [ecchymosis]

2> Familial	Transthyretin [liver] ↑ genetic	Age > 20 yrs M/c = CVS organ M/cc of death - CVS unique = ascending neuropathy	1) Liver Transplant only cond" where liver Transplantation is done ☐ out Liver failure

New Rx
TAFAMIDIS
↳ stabilizes ↓ transthyretin

3) Senile Cardiac Amyloidosis — Transthyretin ↳ Age. — Age > 70 yrs — Tafamidis

M/c organ } - CVS
M/c cause of death }

* 2° amyloidosis doesn't cause restrictive CMP
* ECG will show Low voltage QRS as amyloid is poor conductor
* ECHO = ↑ ventricle wall QRS

(B) Infilteration Inside Myocyte.

1) Haemochromatosis

M/c pattern of CMP → DCMP > RCMP

M/c of death in untreated pt → CVS

M/c of death in treated pt → HCC

Rx - Phlebotomy → [CMP is reversible]

2) Fabry's Disease

cause - Def" of α-~~glu~~ galactosidase
↓
Glycosphingolipid accumulate

C/F.

→ Recovery (c out any complication)

→ (or) Pericardial effusion → if ↓ rapid → Cardiac Tamponade

→ (or) Constrictive Pericarditis

ACUTE PERICARDITIS

[ause- M/c- Idiopathic

Symp-
1) M/c- chest pain [due to rubbing c mediastinal pleura]

?

Ac. Pericarditis

Site- M/c Retrosternum

Nature- sharp pain

Radiation - Trapezius

Aggravating factors - Supine (as area of contact c pleura ↑)

Releiving factor - Leaning forward
Not relieved by nitrate

Ischaemic Pain

Retrosternum

Dull / constricting

Never sharp

(L) arm. forearm

Never Radiate to Trapezius

Exertion
Cold Temp

Rest
Sublingual nitrate

Sign - Most Specific ⇒ Pericardial Rub.

- Crackling sound due to rubbing of 2 inflammed pericardial layers
- Diastolic Phase

Ix

ECG :-

Stage of Ac. Pericarditis

I

PR segment depression +
ST concave upwards ST elevation
[Smiling Phase ST elevation]

II

Colchicine → (no response) → steroid

anti-inflammatory +

anti-fibrotic

TAMPONADE

Cause - M/c (overall) - idiopathic
M/c in India - TB

Pathophysio - Acute
"Compression" of heart + venous roots + Aortic roots
↓↓ venous return (40-50mL) ↓↓ CO

Compensatory vigorous ventricle contrac" to maintain CO.

Obstructive or shock
Compressive

Symptoms -
M/c → Dyspnoea due to ↓ in resp. M/s perfusion

* Not due to Pulmonary congestion.

Lungs - Oligemia

Signs -
Pulse - Pulsus Paradoxus
≥ 90% cases
↓
⊖ in Tamponade

CONSTRICTIVE PERICARDITIS

idiopathic

TB

Chronic
"Failure of relaxation" of heart due to stiff. Pericardium + CO is preserved
↓↓ venous return (100mL)

Compensatory vigorous ventricle contrac" to maintain CO

M/c → Swelling
due to the ↓ in venous return.
⇓
Hydrostatic 'P' ↑ in systemic veins

≤ 1/3rd cases

Absent Pulse Paradoxus in Tamponade

Tamponade

1> AR

2> CHF

JVP — Deep x

Vigorous RV constriction ⇓ Tricuspid ring pulled downward

Deep x

y = Absent

a = Prominent

y = Rapid

v = Prominent [failure of relaxation of RA]

Kussmaul sign = ⊖ as venous return doesn't ↑ significantly in Tamponade

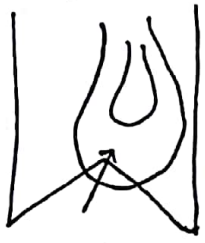
[Non specific ST ↓ or T ↓]

Rx

Emergency Pericardiocentesis

Routine - Pericardiectomy



[ECHO]

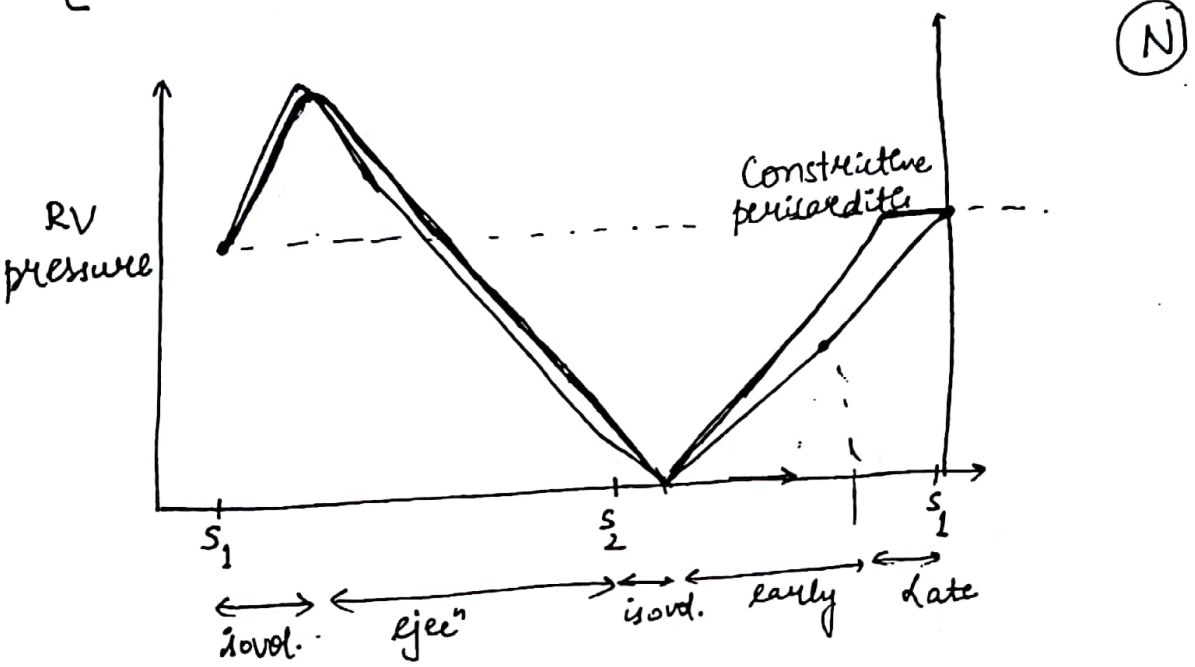
Needle [Subxiphoid area]

Signs	Description	Best Δ
1) Auenbrugger's Sign	Epigastric Bulging	Massive pericardial effusion
2) Beck's Triad	↓ BP + ↑ JVP + soft HS	Tamponade
3) Ewart's Sign.	compress (L) side airway ⇓ Collapse of distal lungs ⇓ Bronchial Breath sound (L) Infrascapular area	Massive Pericardial Effusion

4) Broadbent's sign — systolic retraction of apex due to fibrous pulling — Constrictive Pericarditis.

"Square root" sign → Constrictive Pericarditis.

[Pressure changes in RV]



LMP

SYSTEMIC HTN

Classification [AHA guideline NOV 2017]

	SBP		DBP
1) Normotensive	<120	AND	<80
2) Elevated	120-129	AND	<80
3) Stage I HTN	130-139	(OR)	80-89
4) Stage II HTN	≥140	(OR)	≥90

Causes

I. Essential / 1° HTN (no identifiable cause)
M/C cause

II. 2° HTN (identifiable cause)

↓

1) M/c 2° cause - Reno-Parenchymal
[GN, Chr KD.].
Mc Mech → vol. overload

2) 2nd M/cc of → Reno-Vascular
[Renal artery stenosis]

Mech - ⊕ RAAS

DOC - ACE-I in U/L stenosis

3) Activating Mutation of Sodium channel of tubules.

↓ DCT - Na^+ Cl- channel
Δ GORDEN'S SYNDROME

↓ CD = ℮ Na^+ channel
Δ - Liddle's Syndrome

DOC - Thiazide DOC = Amiloride.

47. Endocrine causes.

	Endocrine	Type of HT	Edema
a)	Hypothyroid	DBP ↑ (Compress bld. vessels ←	⊕ Myxoedema
b)	Conn's Syndrome Chr. ↑ aldosterone ↳ vessels fibrosis	DBP ↑	⊖ ANP released ↓ "Escape" Mechanism
c)	Hyperthyroidism	SBP ↑ (due to ↑CO)	⊖
d)	Phaeochromocytoma	SBP + DBP ↑ sustained HT > Episodic HT	⊖

5) Miscellaneous Causes

a) M/C Cong. CV cause of HTN ⇒ Coarctation of Aorta

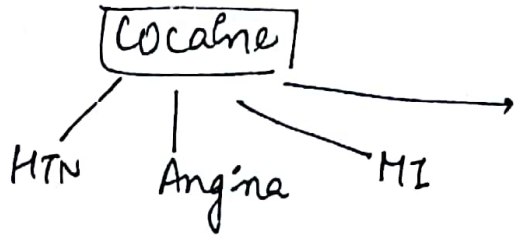
b) Systemic HTN ← sympathetic ↑ ⇒ Obstructive sleep Apnoea

+

Pulm. HTN ← hypoxia

c) PCOD = Insulin resistance
[acanthosis nigrans]

d) Drug NSAIDS by ↓ GFR
Corticosteroid
estrogen



Symptom

1) M/c - Dyspnoea [due to LHF]

M/cc of CHF = HTN

2) M/c symp due to HTN → Occipital Headache

3) Sign :) LVS_4 + (due to LVH)

I_X -

ECG Changes

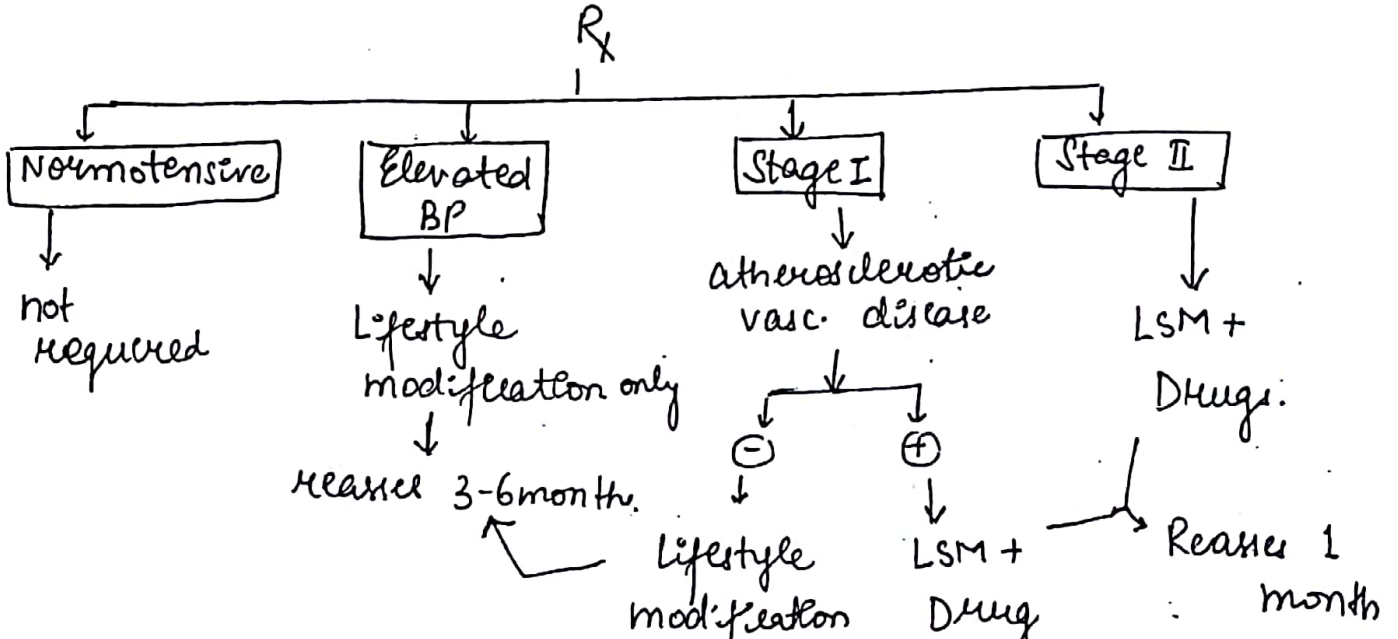
1) LVH signs

2) LA enlargement

3) LAD

R_X

Stable ≥2 reading on ≥2 occasions should be ↑ to Δ HTN



* Lifestyle Modification

1) wt. reduc"
2) ↓ Na ≤ 1.5gm/day
3) ↑ K 3.5-5gm/day cause smooth M/s relaxation
4) DASH DIET
   Dietary Action To Stop HTN
   ↓ Na^+, ↓ Fat dairy product,
   ↑ Fruits & Veg., ↓ saturated fat
5) Brisk Walk / Exercise ≥ 150 min/wk
6) Alcohol ♂ < 30g/d ♀ < 15g/d

Other Terms

1) Resistant HTN
   if BP ≥ 140/90 despite ≥ 3 drug (one of ⊆ is diabetic)
   or
   if BP < 140/90 ⊆ ≥ 4 drug
   H/cc → Non-compliance

2) White Coat HTN
   Incidence if SBP > 20 &/or DBP > 10 from non clinical readings.

3) HTN Emergency = if BP > 180/120 ⊆ Target Organ Damage

I.v. Labetalol	← 1)	Haemorrhagic Stroke
I.v. ~~Nitro~~ NTG or Nicardipine	← 2)	Ac. cardiogenic Pulm. Oedema

SLE Dominant	RA Dominant
Immunosuppression	DMARDS
Non-erosive arthritis	Erosive arthritis

PROGNOSIS – Better than individual disease

Better response to therapy

APPROACH TO JOINT DISORDERS

TRUE ARTICULAR	PAIN	PERI-ARTICULAR
✓	Active	✓
✓	Passive Movement	✗

INFLAMMATORY	Morning Stiffness DURATION	DEGENERATIVE
>30 mins		<30 mins
Resolves	AFTER ACTIVITY	Worsens → OSTEOARTHRITIS

APPROACH TO INFLAMMATORY ARTHRITIS

- MONO (1 joint)
  - → N/E Trauma
  - → Septic
  - → GOUT
- OLIGO (2-4 jts)
  - PSEUDOGOUT
  - ↑ Crystal
- POLYARTHRITIS (≥5 jts)
  - AXIAL: Ankylosing Spondylitis
  - APPENDICULAR - dominant

Symmetrical (small)

- RHEUMATOID ARTHRITIS
- PSORIATIC ARTHROPATHY (Early DIP +)

Asymmetrical (Large)

- ENTEROPATHIC ARTHROPATHY
- REACTIVE ARTHRITIS — Predominantly wt. bearing jt.

Spondyloarthropathy → (4) = AS + above 3

M/c Pattern of Joint Involvement in Diseases

↓

Most Imp parameter for Diagnosis of arthritis

RHEUMATOID ARTHRITIS

Epid- 30, 50yrs; ♀ > ♂

M/c - Idiopathic

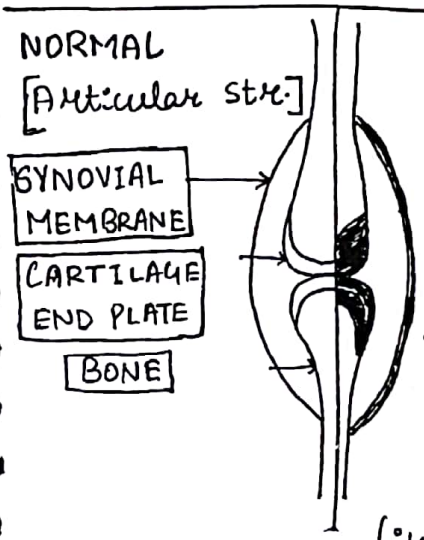
Risk Factors - 1) GENETIC - HLA-DR4 (Most cases = sporadic)

2) INFECTION = Mycoplasma, EBV.

C/F

ARTICULAR (predominant)

- → Inflammatory Poly. arthritis
- → Appendicular Dominant
- → Spine involvement - Rare
  - ↳ M/c - Atlanto-axial jt.
- → Symmetrical, small jts. of hand Wrist, MCP jt & PIP jt



EXTRA-ARTICULAR

EPISCLERITIS

LUNG: M/c Usual Interstial Pneumonia (UIP)

M/c → ♂

Pericarditis

Valvular M/c → MR

MUSCULO-SKELETAL

↓ Myopathy ↓ Osteopenia

Fast progress - OA

FELTY's (RA + Spleen)

↓

Anaemia / Neutropenia

Risk of Lymphoma

Least common

≤ 1% - advanced RA

Early DMARD Rx

Δ :- EULAR (European League against Rheumatism) Guideline - A scoring system

Ⓐ PATTERN of joint involvement (Max : 5)

- 1 jt (Predom. Large) → 0
- 2 - 10 jt → 1
- 1 - 3 jts → 2
- 4 - 10 jts (Predom. small) → 3
- > 10 jts → 5

Ⓑ SEROLOGY (Both RAF & ACPA) [Max = 3]

NEGATIVE → 0

MILD ⊕ [< 3 × upper normal limit] → 2

STRONG ⊕ [> 3 × upper limit] → 3

Ⓒ DURATION

< 6 wks - 0

> 6 wks - 1

Ⓓ ACUTE PHASE REACTANT

NEGATIVE → 0

ELEVATED → 1

Δ = ≥ 6 confirms RA.

RADIOLOGY ⊗ → Not recommended for Ass.

OLD CRITERIA :- X-Ray Hand = Bone Erosions

X-Ray - Least sensitive test

MRI - MOST SENSITIVE test

↓

Impractical

Late, irreversible stage

Earliest feature of RA

Juxta-articular osteopenia

↓

NON-SPECIFIC.

℞ Most preferred method → STAGE the severity

CDAI (Clinical Disease Activity Index)

2.8 - 10	10 - 22	>22
MILD RA	MODERATE RA	SEVERE RA
Single DMARD	COMBINATION DMARD	Early use of Biologicals

Prognosis :- Favourable → REMISSION → can be acheived in 60-85% cases

POOR PROGNOSTIC FACTORS :-

1> Elderly (>40)

2) ♀

3> >10 jts @ onset

4> High titres of RAF

5> Delay in initiation of DMARD ≥ 3 months

DMARDS	InD"	ADR	Follow-up
METHOTREXATE (MTX)	1st choice (B) single or combination.	BM ↓, Hepatotoxicity (Dose dependent S/E)	CBC, LFT - 3 monthly
	Back bone of Biologicals	MTX induced ILD unpredictable Permanent C/I to MTx use	CXR, PFT Baseline & Annually
		Teratogenicity	Counseling
HYDROXY-CHLOROQUINE	Safest in (6) ♀ 2nd choice	Bull's maculopathy (Irreversible)	Fundus, Exam, Perimetry Baseline & annually SOS
SULFASALAZINE	Safe in (6) ♀ 3rd choice	Gastritis Hepatotoxicity	LFT - Basaline & 3monthly
LEFLUNAMIDE	Approved as Mono Rx completed Family MODEST efficacy (limited use)	No synergy ⊂ other DMARDs 6X ↑ Hepatotoxicity Teratogenicity	Stop ≥2 ovulatory cycles before conception.

BIOLOGICALS = Pathophysiology of R.A.

↑↑↑ Pro-inflammatory cytokines

TNFα most potent (MOST PREFFERED) Anti-TNFα agents + **IL-1** **ANAKINRA** **IL-6** **TOCILIZUMAB**

Stimulates T cell MODULATOR = ABATERCEPT + **Stimulates B-cell** RITUXIMAB

Intracellular signalling pathways of Inflammation

eg. ~~JACK~~ JAK - Janus associated Kinases

TOFACITINIB - Tyrosine kinase ⊖ of JAK. - 1st oral Biological

ANTI - TNF α AGENTS — ADALIMUMAB, GOLIMUMAB S/C every 2-3 wks

~~ETARER~~ ETARNACEPT	INFLIXIMAB	PEGYLATED CERTOLIZUMAB → S/c every 6-8 weeks
Chimeric form Mab against TNF α receptor	Chimeric Mab against TNFα itself	Fully Humanised MAb against TNFα. itself
Limited efficacy	Excellent efficacy Anaphylaxis	Equal efficacy Safety

~~COMMON~~

Common ADR ⇒ Reactivation of TB.

Hence, Screening for active/ dormant TB is mandatory before Anti-TNF α agents.

Tuberculin (MANTOUX)	WHO → In countries (BCG vacc)
→ MOST SENSITIVE.	Best screening Test is
→ BCG vaccination. (false +ve)	Interferon γ assay (TB-GOLD/ ~~quantification~~ quantiferon)

SPONDYLOARTHROPATHY

Group of Disorders characterised by

COMMON FEATURES

1) Seronegative — RAF -ve
2) HLA B27 +ve — Strong family History
3) 1° site - "Enthesis" — Junc" Btw Bone & Tendon.
4) Axial Involvement is not Uncommon.
5) Extra articular manifestations predominate
6) Excellent response to NSAIDS → 1st Line of Rx

SpA are D/D - Inflammatory Polyarthritis

(I) ANKYLOSING SPON. / BECHETROW's / MARIE-STRUMPELL DISEASE

Epid- 10-20yrs, ♂ > ♀, 90% - HLA B27

C/F

ARTICULAR (Axial Dominant)		EXTR-ARTICULAR (Predominates)
Sacro-iliac Joint - M/C	LBP (non-specific) always B/L But asymmetrical	70% → Recurrent U/L ANT. UVEITIES
Lumbar spine	Restricted ~~movement~~ forward bending	
Thoracic spine	Restricted movement	
Cervical spine	Highest level of # in Lower part of Cx spine	

Δ

BEFORE

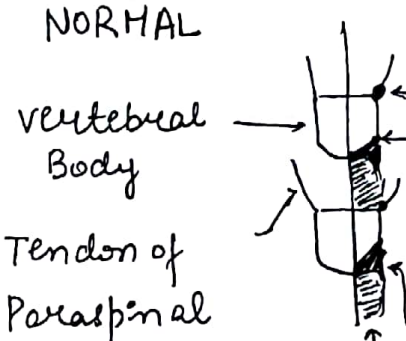
HLA-B27 → +ve → ≥2 common features of SpA (confirms A.S.)

HLA-B27 → -ve → ✗

Spine Involvement

AFTER

MRI proven sacroileitis → ≥1 common features of SpA



STAGES	R_x
ENTHESIS	NSAIDS

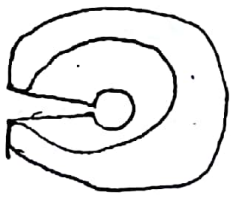
Rx = Lifestyle Modification



RESPIRATORY

LUNG DEVELOPMENT

5 stages

1) Embryonic stage → Lung buds
2) Pseudoglandular stage - upto terminal Bronchole
3) Canalicular - Alveolar ducts
4) Saccular - Primitive alveoli
5) Alveolar - Mature alveoli

BRONCHOPULMONARY SEQUESTRATION

Def^{n}. Separation of part of lung during development from tracheobronchial tree & separate blood supply.

TYPES

EXTRA LOBAR	INTRALOBAR (M/c)
Separated & having separate covering	separated part in adjacent lung & covered by lung's pleura

M/c site → (L) lower lobe post basal segment

M/c Blood supply → Thoracic aorta

IOC :- CT Angiography or MR angiography

Rx - Resection if pt. is symptomatic

SURFACTANT

1) Dipalmitoye Phosphatidyl choline / Lecithen.
2) Produced by Type II pneumocytes
3) also by clara cell.
4) Removed by Alveolar macrophage
5) Functions :-
   a) surface Tension ↓
   b) maintain alveolar stability / FRC
   c) Compliance
6) Surfactant induc" starts at **20wk**
   Peak at **35wk**

So, if < 35 wk ⇒ Respiratory distress syndrome
or
Hyaline membrane Disease.

Pathophysiology of RDS

surfactant deficiency → ↓ collapsed alveoli → To open collapsed alveoli → ↑ work of Breathing → Respiratory Distress

Respiratory Distress → ↓ energy resources → Hypoxemia + Met. acidosis → caused Damage to Alveolar cell → Form Hyaline Layer → HYALINE MEMBRANE DISEASE

Hypoxemia + Met. acidosis → Pul. vasoconstric" → ↑ (R) sided Pr. → Patent foramen ovale → R-L Shunt → CYANOSIS

X-Ray findings :-

1) Reticulo ~~granular~~ granular pattern
2) Ground glassing
3) White out Lungs
4) ↓ lung volume (↓↓FRC)

Inv :-

Lecithin / Sphingomyelin > 2 ⇒ MATURE LUNG

Rx :- mild to moderate ⇒ O_2 + CPAP

Severe ⇒ Invasive Mech. ventilation + Surfactant ~~Deficien~~ Replacement

~~Surfacto~~ [Hyaline appears Pink on Biopsy]

PULMONARY ALVEOLAR PROTEINOSIS

Surfactant clearance is impaired

Etiology :- 1° form (M/C) → Auto Ab against GM CSF

2° form → ✓ Acute Silicosis
✓ Haematopoietic malignancy
✓ Immunodeficiency

Silica particles are toxic to alveolar macrophage
Chr. Silicosis pt are prone to TB.

In malignancy, macrophages are not matured enough to carry out func".

In immunodeficiency, macrophages ↓

Pathophysiology-

↓ Diffusion for O_2 → Hypoxemia.

Δ :-

1) Broncho alveolar Lavage → milky white

2) BAL → PAS +ve

New FeNO = Test for Acute Asthma

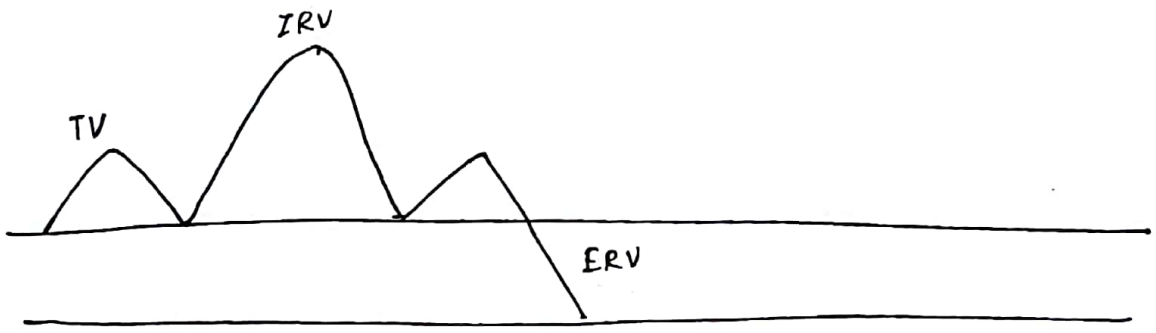
SPIROMETRY

Tidal Volume = Normally in/out = 500 mL

IRV = air accomodated ⊼ effort after ↑ Tidal inhalation = 3000 mL

ERV = air expelled ⊼ effort after Tidal expiration = 1100 mL

RV = Air that remains after ~~flex~~ forcible expiration = 1200 mL



VC = Volume expelled forcibly after max. inhalation.

TV + ERV + IRV

IC = TV + IRV

FRC = ~~E~~RV + RV

TLC = TV + IRV + ERV + RV

VC

IC

FRC

Conventional spirometer = can't measure
- → RV
- → FRC
- → TLC

Methods for RV, FRC, TLC:
- He Dilution Method
- N_2 washout
- Body Plethysmography. (Best)

DYNAMIC LUNG VOL

1) Forced Vital Capacity = Rapid + forcible VC

2) Timed Vital Capacity:
- → FEV_1 = FVC @ end of 1st sec = 80%
- → FEV_2 FVC @ end of 2nd sec = 90%
- → FEV_3 FVC @ end of 3rd sec = 98%

3) PEFR = Peak expiratory Flow Rate
- → Peak of FVC
- → Indicates **Large** airflow flow
- → 400-500 mL/min

4) MEFR → Avg. velocity during mid portion of exhalation.
- → sensitive indication of **small** airway function
- → 300mL/min

(N)	OBSTRUCTIVE	RESTRICTIVE

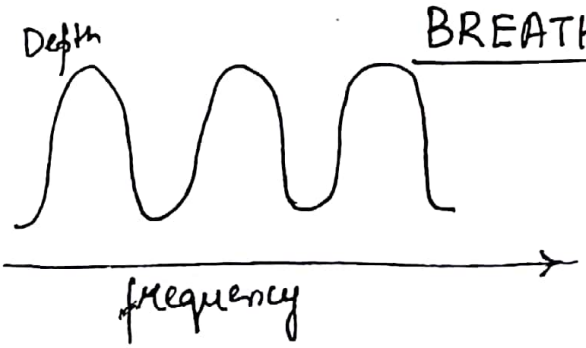
1° Pulmonary HTN

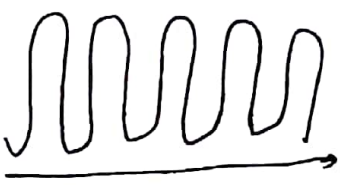
BREATHING PATTERNS



(N)

1) KUSSMAUL'S BREATHING :-

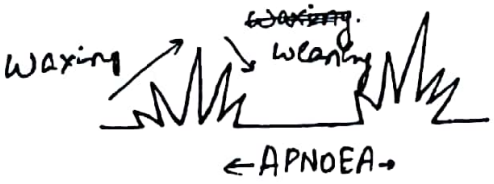
Rapid & Deep Breathing



eg. sev. Metabolic acidosis → DKA, Uraemia

2) CHEYNE STOKES BREATHING.

→ Periodic Breathing ~ cyclical Pattern.



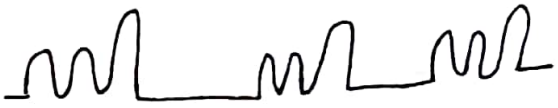
→ altered response to CO_2.

eg of CHF, narcotic overdose, Head injury

3) BIOTS BREATHING

- Irregular respiration ~ Apnoea

eg. Meningitis
↑ ICP



4) ATAXIC BREATHING

Irregularly irregular resp^n ~ ↑ Apnoea

till pt. goes into resp. arrest

eg. Brainstem injury.

BREATH SOUNDS

(N)

→ Vesicular Breathing

→ Similar to sounds of rustling of leaves

→ Low pitch, soft

I:E = 3:1

No pause.

Ab (N)

Bronchial Breathing

Similar to tracheal sound

High pitch, Harsh

I:E = 1:1

pause

1) Tubular Breathing → Consolidation

2) Cavernous " → Cavity

3) Amphoric " → Metallic quality

eg. Bronchopleural fistula

ADVENTITIOUS BREATH SOUNDS :-

WHEEZE (musical)

Produced when airflow past an obstruction due to vibration of airways

- **Monophonic**
  - Local involvement
  - eg. Bronchial Tumour
- **Polyphonic**
  - Diffuse involvement
  - eg. Asthma, COPD

Rhonchi :- Low pitch wheeze

CREPTS / CRACKLES / RALES

Non-musical sounds

1) When air flows into secretions

⇒ Bubbling noise

↓

cause crepts

Bronchiectasis

2) When alveoli suddenly pop open during inspiration

ILD

Velcro crepts

Fine crepts

(B) Fine & Course Crepts

1) P. Oedema (fine >> course)
2) Pneumonia
3) TB

STRIDOR:- Loud, audible, inspiratory & expiratory wheeze due to Laryngospasm
F.B.
Laryngeal oedema
Subglottic stenosis

~~LES~~ -

PULLING	NO PULL/PUSH	PUSHING LESION

RESPIRATORY FAILURE

Low pO_2 < 60 mm Hg , High $Paco_2$ > 45 mm Hg.
(HYPOXIA) (HYPERCAPNIA)

Type I RF - Hypoxemic RF

Type II RF - Hypercapnic RF

Type III RF - Perioperative RF due to lung atelectasis associated ⊼ general anaesthesia

Type IV RF - due to hypoperfusion of respiratory m/s due to shock.

TYPE I

Diffusion Defect
↓ Transfer of O_2.

$P_{A-a}O_2$ = 10 mm Hg

P_AO_2 = (N)

$Pa\,o_2$ = ↓

$P_{(A-a)}O_2$ = ↑↑

$Paco_2$ = (N)/↓

TYPE II

Hypoventilation
↓ Resp. Effort

P_AO_2 = ↓

PaO_2 = ↓

$P_{(A-a)}O_2$ = (N)

$Paco_2$ = ↑

pH ↓↓ (Resp. Acidosis)

CAUSES

Pneumonia
ARDS
ILD
Pulmonary oedema
P. thromboembolism [Highest $P_{A-a}O_2$]

R_x O_2 + R_x of underlying disease

If pt. not improving
Pneumonia
ARDS

Invasive +ve pressure ventilation preferred

CENTRAL CAUSE

Narcotic use
Head injury

OBSTRUCTION

. F.B.
Severe COPD

PERIPHERAL

Neuromuscular Disorder

DIAPHRAGM CAUSE

Palsy

⇒ **COPD** - pneumonia

O_2 + R_x underlying cause

If pt not improving
[COPD / NMD]

Non-invasive +ve pressure ventilation is 1st choice

NIPPV [BiPAP (NIV commonly used)
CPAP]

If no response ⇒ IPPV

C/I of non-Invasive ventilation

1) altered sensorium
2) ↑ chances of aspiration
3) cardiac arrest
4) Hemodynamically unstable
5) Un co-operative pts.

6) Claustrophobic

7) Active GI Bleed

8) Recent Facial Trauma or Sx

ARDS

Defn :- Acute shortness of Breath + Hypoxemia + Diffuse Pulmonary infiltrate

Causes:-

DIRECT

1) Pneumonia
2) Aspirating gastric content
3) Lung contusion
4) Near drowning
5) Toxin inhalation

INDIRECT

1) Sepsis (M/c).
2) Severe trauma
3) ~~Blood~~ multiple Blood Transfusion.
4) Severe Burns.
5) Pancreatitis

OTHER NAMES :-

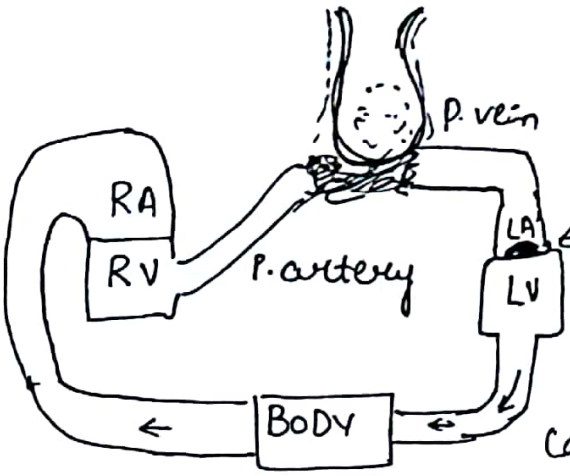
1> Noncardiogenic Pul. oedema
2> ↑ permeability Pul. "
3> Low pressure Pul "
4> Diffuse Alveolar Damage (most characteristic)
5> Shock Lung
6> Wet Lung

Pathogenesis

Cardiogenic P. oedema

Non-cardiogen P.Edema

CARDIOGENIC P. Edema



↓

↑ Pul. Capillary Pr.

↓

Pul. oedema

↓

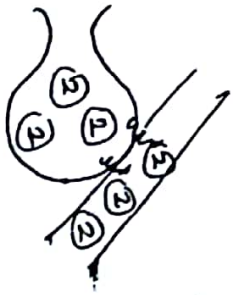
↑ PA. HTN

↓

RHF

PCWP = ↑ in CPE.

NON-CARDIOGENIC



Damage to capillary endothelium & alveolar epithelium.

↑ Neutrophil entry = inflammation.

& damage = ↑ inflammatory exudate.

SHOCK LUNG.

PCWP / Pul. Arterial Occlusion Pressure

→ Swanzganz catheter used

→ Indirect measure of LAP

→ In CPE PCWP > 18 mm Hg

In NCPE PCWP < 18 mm Hg

Dx:- Berlin 2012 Definition

1) Acute Onset < 7 day

2) Origin of oedema ⇒ non-cardiogenic & PCWP < 18 mm Hg

3) B/L diffuse infiltrate in CXR - PA

4) $\frac{PaO_2}{FiO_2}$ < 60 mm Hg / 0.2 = < 300.

$\frac{PaO_2}{FiO_2}$ 200 - 300 = Mild ARDs

$\frac{PaO_2}{FiO_2}$ 100 - 200 = Mod. ARDs

$\frac{PaO_2}{FiO_2}$ < 100 = Severe ARDs

℞ Most Recommended Strategy / Beneficial :-

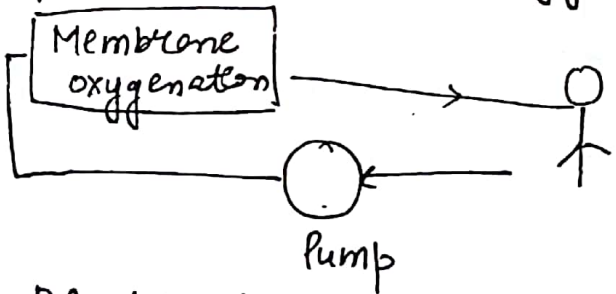
1) Low Tidal Volume Mechanical Ventilation (4-6 mL/kg Body wt.)
- Assist control mode to avoid ventilation associated Lung Injury

2) Adequate +ve End Expiratory Pressure

3) Gluco-corticoid may be helpful.

*Newer Ventilation Mode :-

1) Extra corporeal Membrane Oxygenation.



Mech :- Blood is pumped into membrane oxygenator ⇒ oxygenated blood sent back into body.
Beneficial in severe ARDS.

2) Prone Ventilation.

MECH:: In prone ventilation. diaphragmatic Pressure on lower alveoli ↓ ⇒ ↑sed alveoli for oxygenation

~~at wt. of abdomen ↓~~

For Benefit ⇒ Done for 16 consecutive hours.

→ Helpful in improving oxygenation in pts c severe Hypoxemia.

→ Not helpful in pt. c pre-existing chest wall deformity/ severe fibrosis.

3) High Frequency Oscillator Ventilation

→ Low tidal volume are given c more frequency

→ Beneficial in few studies

TRALI

(Transfusion Related Acute Lung Injury)

→ Occurs in or during 6hr of transfusion.

→ Donor Plasma antibodies Vs Recipient leukocyte

→ Mediator release

→ Feature of ARDS

Rx: supportive

H/o of Transfusion related fatality

P. THROMBOEMBOLISM (M/c of Cor. Pulmonale)

Migration of thrombus ∫ into Pulmonary artery

M/c source: Pelvic veins.

CAUSES

1°

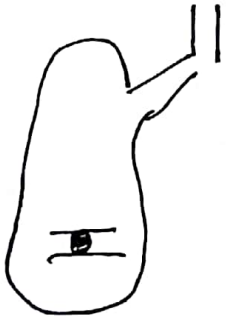
1) Protein C, S deficiency
2) Factor V Leiden mutation.
3) Lupus anticoagulant
4) Antiphospholipid antibody syndrome
5) Hyper homocysteinuria

2°

1) Prolonged immobilisation
2) Recent Trauma. Sx
3) High estrogen state
   eg. ♀,
   estrogen containing pills
4) malignancy
5) Nephrotic syndrome

PATHOPHYSIOLOGY

LUNG



1) ↑ Pul. arterial Pressure
   ↳ rupture of vessel
   ↓
   Hemoptysis

2) ↑ Alv. Dead space = Hypoxemia
   ⇓
   Shortness of Breath.

3) ↑ Serotonin by platelets

Poore response

CLINICAL CLASSIFICATION

TYPICAL

Fever + Productive cough

Predominant neutrophilic leucytosis

Gram staining → reveal organisms

CXR → Alveolar exudates

M/c - Strept. Pneumoniae

Staph. aureus

Klebsella

Pseudomonal

ATYPICAL

Interstitial Inflammation

Fever + cough ⇒ scanty sputum

Mild Leucocytes

Gram staining → no organism

CXR - NO alveolar oxidation

- Interstial pattern

M/c - Mycoplasma

Legionella

Coxiella

Chlamydia

Viral Pneumonia

TYPICAL PNEUMONIA

(I) STREPT

Risk Factors — M/c
- Smoker
- alcoholic
- DM

c/F Red rusty Sputum

CXR  Localised involvement of lobe/segment

(M/c) pattern in CAP

Rx - β lactams

(II) STAPH

IV drug users pneumonia

Fatal pneumonia post viral illness

mucopurulent sputum

CXR 

Bronchopneumonia

B/L, patchy involvement

(M/c) pattern in nosocomial Pneumonia

Pneumatocele + cavety + Lung abscess may be seen

Rx MRSA = Vancomycin

VRSA = Linezolid

(III) KLEIBSELLA

Alcoholics
DM
malnourished

Red currant Jelly Sputum

CXR 

Bulging fissure sign

- cavities
- Dense consolidation
- Lower lobe involvement seen if hematogenous spread

Rx -
Blactam + Aminoglyoside

(IV) PSEUDOMONAS

→ Frequently occurs as VAP

→ occur as Recurrent pneumonia in → Structural Lung disease, cystic fibrosis, Bronchiectasis

→ Fever, mucopurulent secretion, Leucocytosis.

- B/L infiltration of CXR

Rx - Two Anti pseudomonal ABs of 2 different class.

Antipseudomonal ~~ABs~~ β lactam + FQ (or) Aminoglycoside

ATYPICAL PNEUMONIA

MYCOPLASMA / Walking P.

M/c atypical pneumonia

Eaton agent pneumonia

Man → Man transmission.

Extrapulmonary features

1) CNS - GBS
peripheral neuropathy

2) Ear - Bullous myringitis

3) Blood - ↑ cold agglutinins
Heamolytic anaemia

4) CVS - Myocarditis
Pericarditis

5) Skin - Erythema Nodosum

No cell wall (+)

Rx - Macrolide / FQ / Tetracycline

LEGIONELLA

M/c mode of Transmission -
micro aspiration > Aerosolization

Spreads through contaminated water

Limited man to man transmission

Special Features :-

1) Associated GI features : diarrhoea

2) " CNS features :-
confusion, headache,
high grade fever

3) Altered LFTs

4) S. Na^+ < 130 meq

Gram staining → no organism

Poor response to β lactams

Old age, Immunocompromised

occurs in 10 days discharge from hospital

Rx - FQs / Macrolide / Tetracycline

↓

Resp FQs - Levo / Moxi

PNEUMOCYSTIS PNEUMONIA (PCP)

M/c opportunistic infection in HIV = TB

M/c pneumonia in HIV = TB

M/cc pleural effusion in HIV = TB

M/cc fungal pneumonia in HIV = PCP

R/F:-

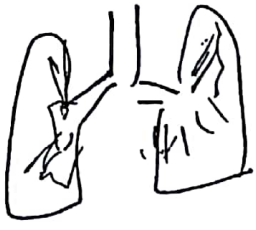
1) $CD_4 < 200$ /µL in HIV
2) Long Term Immunosuppressive Rx
3) Organ Transplant
4) 1° Immunocompromised

C/F:-

Subacute onset
Fever
Shortness of Breath
Hypoxemia

CXR:-

Perihilar infiltrates
Diffuse interstitial infiltrate
In few - pneumatocele
Complicate a Pneumothorax



Δ:- Visualize the cyst → Wright - Giemsa
→ Gomori - methamine stain.
Broncho-alveolar lavage (Best sample)

Rx - COTRIMOXAZOLE (Septran)

If sulpha allergy → 1) Clendamycin + Primaquine
2) Trimethoprim + Dapsone
3) Pentamidine
4) Atovequone

DOC for Prophylaxis → COTRIMOXAZOLE
↓
DOC for NOCARDIOSIS.

VIRAL PNEUMONIA

BIRD FLU (H_5N_1)

- Avian Influenza
- Less M → M transmission
  Epidemic not pandemic

DOC - Oseltamivir

SWINE FLU (H_1N_1)

- ↑↑ M → M transmission
- Epidemic + Pandemic

DOC - Oseltamivir
75mg BD for 5 days
(neuraminidase Inhibitor)

Doc prophylaxis - Oseltamivir
75mg OD for 10 day

other drugs - Zanamivir
Peramivir

ASSESMENT of SEVERITY_

C onfusion

Urea > 7 mmol/L or > 20 mg

RR > 30/min

B - SBP. < 90 mm Hg DBP < 60 mm Hg

65 Age age > 65

0-1 ⇒ Home Rx ē antibiotic

2 ⇒ Hospitalisation . Rx

3-5 ⇒ Consider as severe pneumonia , may require ICU admincon.

LUNG ABSCESS

1° ~~ABS~~ form

M/c type

Due to aspiration

M/c organism - oral anaerobes

↓

Rx - IV - Clindamycin.

2° form

Occurs due to pre-existing disease process in lung

Bronchial obstruction

Immuno deficiency

Staph, Klebsiella

Rx - Broad spectrum ABs

Strategies to Prevent VAP :-

1) Elevation of Head of Bed 30°-45°

2) Oral Decontamination ⊂ Chlorhexidine

3) Sedation vacation (↓ sedation)

4) Assesment of readiness to extubate daily

5) Use of NIV wherever feasible

X Frequent change of Tubex

ORAL ANAEROBES-

→ Peptostreptococci

→ Fusobacterium

→ Bacteroide

PLEURAL EFFUSION

LIGHT's CRITERIA (H/c)

TRANSUDATE

$\frac{\text{Ple. fluid. Protein}}{\text{S. protein}} < 0.5$

$\frac{\text{Pl. fluid LDH}}{\text{S. LDH}} < 0.6$

Cause-
1> CHF (H/cc overall)
2> Hepatic Hydrothorax
3> Nephrotic Sx

EXUDATE

> 0.5, 0.6.

Cytology = ? malignant cells
cell count
Gram staining ? infection
TB marker = ADA, Interferon γ

Special Features

1> Low glucose ple. fluid (< 60mg%)
a> Empyema
b> Malignancy
c> RA
d) TB (Rare)

2> High Amylase
a) Pancreatitis
b) Oesophageal rupture
c) malignancy

3> High Lipid Ple. Eff / white coloured

Chylothorax
Accumulation of Chyle due to disrup' of thoracic duct
Pl. TGA > 110mg%
H/c - Surgical Trauma, Malignancy

Pseudochylothorax
Accumulation of cholesterol crystals in long standing eff.
TB, RA, Ch. empyema, myxoedema
cholesterol > 200 mg%.

Milky white BAL
193
Alveolar Proteinosis

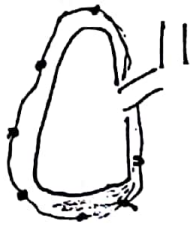
* Parapneumonic Eff
  M/c of exudative Pleural Eff
  Eff associated c Pneumonia
  Bronchiectasis
  Lung abscess

Indications of ICD insertion in parapneumonic Eff :-

1) Pus in pleural cavity
2) pH < 7.2 (pleural fluid)
3) Ple f. glucose < 60mg%
4) Loculated pleural effusion
5) Gram staining reveals organisms

TB Effusion

- M/c exudative effusion in India
- Occurs due to hypersensitivity response to TB Bacilli in Pleural Tissue



- Exudative — Lymphocyte predominant
  ADA >40 IU
  IFN γ > 140 pg/mL
  ↓ mesothelial cells
- Pleural Fluid for AFB only positive in 20-30% cases.
  Gold Std — Thoracoscopic pleural Biopsy + Culture for M. tb.

PNEUMOTHORAX & PNEUMOMEDIASTINUM

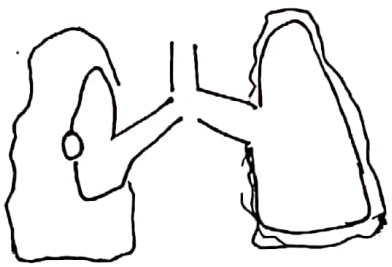
Classification of Pneumothorax :-

- SPONTANEOUS
  - 1°
    - No underlying Lung disease
  - 2°
    - Pre-existing lung disease
      - COPD (Mcc of 2° spon. pneumothorax)
      - Bronchiectasis
      - ILD, TB
- TRAUMATIC
  - Iatrogenic
    - 1) Transthoracic needle aspiration (Mlc)
    - 2) Mech. ventilation
    - 3) Insertion of subclavian catheter
  - Chest wall injuries
    - RTA.

TENSION PNEUMOTHORAX

1> Large air leak

2> Air Leak serves as Ball valve (or) one way valve mechanism



3> ↑↑ Positive intrapleural Pressure

4> Compressing adj lung + medastenal vessels

↓

↓ VR

↓

Shock (medical emergency)

5> Rx- Next step / Best step- Insertion of wide bore needle @ 2nd I.C.S. anteriorly mid clavicular line on affected side followed by ICD insertion.

High Inspiratory Pressure alarm on ventilator can suggest ~~Pneu~~ Tension Pneumothorax.

Pneumo Mediastinum

Air in mediastinum

C/F - Shortness of Breath
Chest pain
HAMMAN'S Crunch → Crunching sound synchronous c heart Beat

CXR - Continuous Diaphragm Sign.
Subcutaneous Emphysema

ASTHMA

Characterised By recurrent symptoms due to variable & reversible bronchoconstric" caused due to airway hyper-responsiveness to variety of stimuli

COPD - characterised by persistent symptoms & airflow limitation due to airway & alveolar abN caused by significant exposure to noxious stimuli.

ASTHMA	COPD
Allergan related	Smoking related
Reversible airflow limitation	Persistent airflow limitation
Early Presentation	Delayed presentation
Relief c Bronchodilators	only partial response

TYPES & PATHOGENESIS

EXTRINSIC / ATOPIC / ALLERGIC	INTRINSIC / ~~NONALLERGIC~~ NONATOPIC / IDIOSYNCRATIC
Allergen related	Viral infection ⇒ Trigger
S. IgE ↑	S. IgE (N)
Skin test +ve for allergen	Skin test -ve
Mild form	Severe forms
Young onset	Late onset

M/C allergen world
↳ HOUSE DUST MITE / Dermatophagoides

Pollen → cause Thunderstorm Asthma

Δ :-

1) SPIROMETRY

obstructive

Bronchodilator reversibility = ↑ FeV_1 > 12% (or) 200cc after SABA.

FeV_1 65% $\xrightarrow[15\,min]{SABA}$ FeV_1 80%

2) PEFR variability

>20% diurnal variation.

3) METH. CHOLINE challenge Test / Broncho provocation Testing

fall in FEV_1 > 20% after meth. choline.

for airway hyper-responsiveness

4) FeNO > 50 PPb ≈ Eosinophilic inflammation.

ACUTE SEVERE ASTHMA.

C/F-

1) Pt. speaks in words
2) can't recline
3) RR > 30/min
4) HR > 120/min
5) B/L Wheeze
6) Accessory muscle use
7) Pulsus Paradoxus → [Raped change in intrapleural pr. causes this.]

Functional Parameters :-

1) PEFR < 50% predictive value.
2) SpO_2 < 90%
3) PaO_2 < 60mmHg

→ Type I Resp. Failure

~~First~~ Type 2RF can occure in severe cases
↳ due to fatigue of resp. muscles.

* Life Threatening Asthma :-

1) Patient - altered sensation
2) Silent chest
3) ↓ Respiratory effort
4) PaO_2 < 60mmHg
5) $PaCO_2$ ↑↑

Rx - 1) O_2 +
2) SABA + (salbutamol) + Inhaled corticosteroid
· SAMA (Ipratropium)
2) I.V. Steroid ← ↓Inflammation
↑ sensitivity of β_2 receptor to bronchodilator

3) Theophylline now not used routenely

4) In few cases **IV $MgSO_4$** given

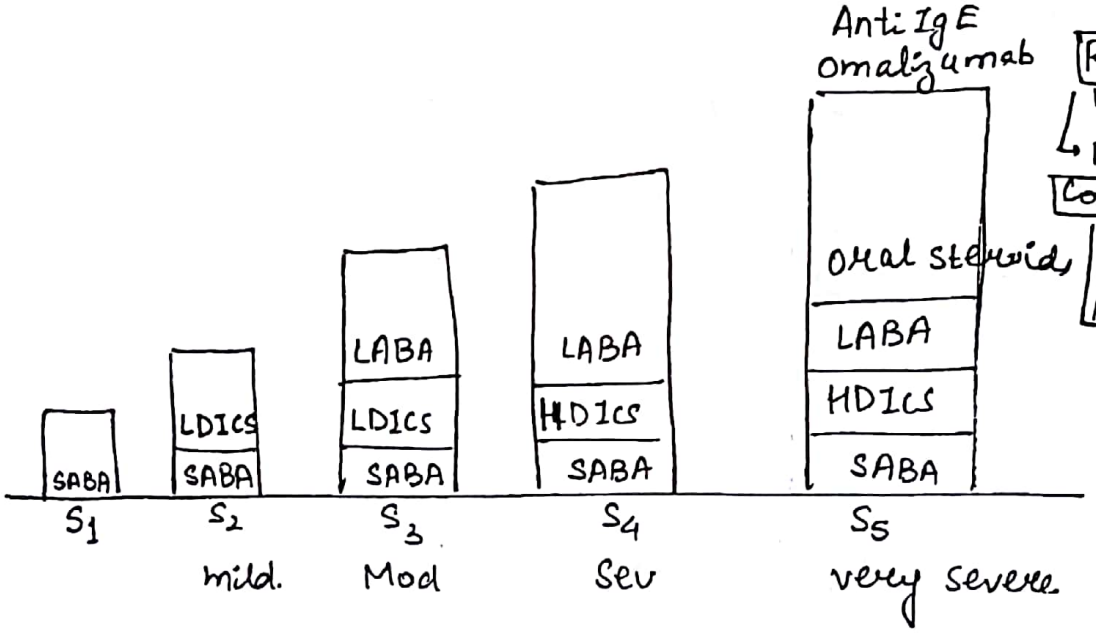
5) In deteriorating /life threatening case ⇒ **Invasive** Mech. ventilation.

↙ High inspiratory flow

↘ ↑ Expiration Time I:E = 1:3 or 1:7.

Step Wise Therapy & Classification

	Intermittent	Persistent		
		Mild	Mod	Sev
Day Time S_x	< 2/week	> 2/week	daily	through-out day
Night time awakening	< 2/month	> 2/month	> 2/week	daily



LDICs → low dose ICs.

HDICs → High dose ICs.

Most Imp. in Asthma management is pt. ~~self~~ education & active self Mx. 199

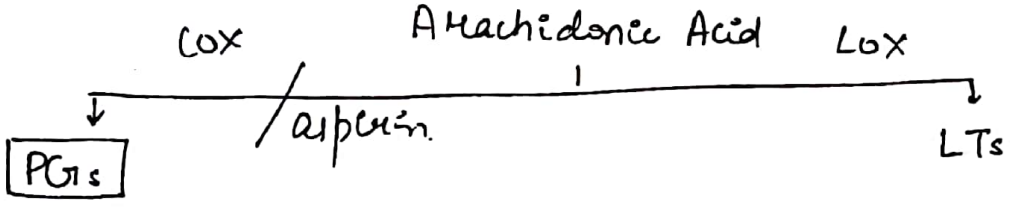
EXERCISE INDUCED ASTHMA

In susceptible individuals, exercise can induce asthma more frequent during cold & dry climate > hot humid condition.

DOC for short term prophylaxis = SABA > Anti-leukotriens / Mast cell stabilizer.

DOC for Long term prophylaxis & overall control of disease } Corticosteroids

ASPIRIN INDUCED ASTHMA



Samter's TRIAD–

Nasal polyposis + Aspirin sensitivity + Asthma

In susceptible individuals. aspirin blocks COX pathway & shifts balance towards LOX pathway ⇒ ↑ LTs ⇓ Bronchospasm.

Rx = ICS + ~~Aspirin~~ SABA + Anti-leukotrienes + Aspirin desensitization.

BRITTLE ASTHMA

Unstable Disease ≈ frequent exacerbations

(N)	Type 1 Brittle	Type 2 Brittle
Lung function	Persistent fluctuation in lung functions 	Near normal Lung function → Rapid fall . death. 	Difficult to Rx asthma * Oral corticosteroids + continuous infusion = β_2 agonist	Localised anaphylaxis ↓ Laryngospasm DOC :- Subcutaneous epinephrine + Adrenaline

CORTICOSTEROID RESISTANT ASTHMA

Poor response to Rx after 2 weeks of oral corticosteroids (40mg/day) Rx

steroid sparing drugs can be used.

Anti IgE = **Omalizumab.**

Anti IL5 = **Mepolizumab**

COPD

CHR. BRONCHITIS :-

Cough ± sputum for >3 months in 2 consecutive years

EMPHYSEMA :-

Destruc" distal to terminal bronchiole.

R/F :-

1) Smoking
2) α_1 AT Deficiency
3) Indoor + outdoor pollution.
4) ~~Cold~~ exposure coal.

→ young age
→ Less smoking H/o
→ Family H/o - Chr. 14, AR.
→ B/L Lower predominant
→ Bronchiectasis
→ Unexplained Liver Disease.

2)

TYPES OF EMPHYSEMA

CENTRIACINAR	PANACINAR	DISTAL ACINAR
<u>occurence</u> Smokers M/c overall. Upper lobes	α_1AT Def. More severe in LL	Adjacent to fibrotic foci. Upper 2/3rd of Lung
<u>Pathology</u> 		
RB involved alveolar duct + Sac spared	Resp. Bronchiole + Alv. Duct + Sac involved	Resp. Bronchiole spared Alv. duct + sac involved

Δ:- 1) SPIROMETRY

$\frac{FeV_1}{FVC} < 0.7 \approx$ Obstructive

No significant Bronchodilator reversability

GOLD Staging (Global Iniative for obstructive Lung Disease)

I Mild $FeV_1/FVC < 0.7$ FeV $\geq 80\%$ Pred FeV_1

II Mold. " " " FeV_1 50-79 % " "

III Severe " " " FeV_1 30-49% " "

IV very severe " " " $FeV_1 < 30\%$ pred. value

Prognosis Index

BMI

Obstruction (FeV_1)

Dyspnoea (MRC scale)

Exercise Capacity ⇒ Distance covered in 6 minute walk test

Low score ⇒ Good Prog.

High score ⇒ Poor Prog, ↑ mortality

CHARACTER	BLUE BLOATER	PINK PUFFERS
PATHOLOGY	Chr. Bronchitis.	Emphysema.
SYMPTOM	Cough ± expectoration	Shortnes of Breath
APPEARANCE + POSTURE	obese + comfortable at rest	lean + tachypnoeic at rest
Breath sounds	Rhonchi - Noisy	Less noisy
CXR	↑ Interstitial Marking obstructive	Hyperinflated Lung obstructive

Rx :-

1> Smoking cessation. → most imp. intervention.

2> BRONCHODILATORS

A> LABA

Ultra LABA → O.D. Dose

- ✓Indacetrol
- ✓Vilanterol
- ✓Oladetrol

B) LAMA

Tiotropium

Umiclinidium

Glycopyronium.

3> STEROID :-

a) Inhaled

↓ freq. of exacerbation

b) Systemic

During exacerbation.

4> SELECTIVE PDE_4 INHIBITOR :-

Roflumilast

5> ANTIBIOTICS :-

During exacerbation (H. influenza)

6) MUCOLYTICS -

N Acetyl cysteine

7) If Hypoxemia → Long Term O_2 therapy (15 hours a day)
low flow O_2

8) Lung volume Reduction surgery

9> LUNG TRANSPLANTATION (M/c Indication for lung transplantation in COPD)

10> During exacerbation, 1st choice - non-invasive ventilation.
> Invasive ,,

BRONCHIECTASIS

Ab Ⓝ Permanent Dilatation of bronchi due to loss of muscle & elastic tissue.

Initiating event
↓
Altered mucociliary clearance
↙
obstruction.

Vicious Cycle Theory

↓
Recurrent infection → Inflammation → Destruction & dilatation → Altered mucociliary clearance

C/F :-
copious sputum
coarse crepts

ETIOLOGY & MECH :-

I) BRONCHIAL OBSTRUCTION

a) Intramural

Tumours - Carcinoid
Sq. cell carcinoma
Small cell carcinoma

b) Extrinsic Compression.

Enlarged TB hilar LN can compress Ⓡ middle Lobe Bronchus → Ⓡ middle Lobe collapse & bronchiectasis
⇓
BROCK'S SYNDROME.

II> BRONCHIAL INJURY

A) Infection

TB, adenovirus

B) Altered Immune response

→ Connective Tissue Disorders

→ Allergic Bronchopulmonary Aspergillosis (ABPA)

III> TRACTION BRONCHIECTASIS in ILDs

IV> GENETIC CAUSES

A> 1° ciliary dyskinesia

B> Cystic fibrosis

C> Cartilage Defect

- William campbell s.
- Mounier Kuhn syndrome

D) Yellow Nail Syndrome

Cong. Lymphoedema + Yellow nail + Pleural Effusion + Bronchiectasis

CYSTRIC FIBROSIS

Inheritence - AR

Chromosome 7q

Gene - CFTR

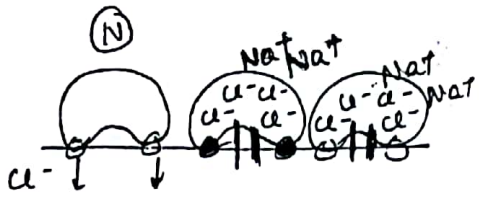
Channel - Cl^-

Mutations - Class I - VI

M/c class II, ΔF508

" Thick secretions "

(I)



Resp. Tract

GIT

Reproductive Tract

watery secretions

Thick viscid secretions dehydrated

(II)

Sweat Gland

ENaC → responsible for pathophysiologic process

SCREENING Test

↑ Sweat Cl^- > 60 mEq.

Other Inv:-

1) DNA analysis for mutations

2) ↑ Nasal Pot^n Difference

3) CFTR Gene sequencing :- Gold Std.

SYSTEMIC MANIFESTATIONS:-

1) Respiratory Tract -

URT
↓
Recurrent infections
Sinusitis

LRT
↓
Recurrent pneumonia
(M/c pseudomonas), steph.
Bronchiectasis, Lung abscess
Empyema, P. thrombosis,
Resp. failure, Hypoxemia,
P. HTN, Cor Pulmonale

2) GIT
neonate Meconium ileus.

Liver → Biliary cirrhosis,

GB - Gall stone

Pancreas

- Exocrine insufficiency - early manifestations
- DM, → occurs later.

3) Reproductive Tract -

♂ In utero occlusion of vas Deferens by thick secretions → AZOOSPERMIA. → infertile

♀ Thick cervical secretions

℞

1) CFTR Modulators :-

Ivacaftor - G551D mutation class III

Lumecaftor + Ivacaftor - tried in class II

TYPES OF BRONCHIECTASIS -

H/c - Cylindrical Varicose Saccular

SITES of B'XIs -

1) Upper Lobe

1) Cystic fibrosis
2) TB
3) Post radiation BXIs

2) Lower Lobe

1) Interstial Lung Disease
2) Chr. recurrent aspiration
3) Immunodeficiency state

3) Middle Lobe - non-tubercular mycobacterium.

Mycobacterium avium complex (MAC)

Rx of B'XIS-

1) Airway clearance.

Mucolytics ← → Chest Physiotherapy.

2) Antibiotics

During exacerbation

Prophylaxis

- Long term: Azithromycin (6 months)
- Inhaled: Tobramycin (1 month on-off)

3) Bronchodilator + ICS beneficial in some

4) If Hypoxemia ⇒ O_2.

5) Localised Disease → Sx

6) Diffused " → Lung Transplantation.

High flow O_2 not recommended. Y ?

1> Abolition of Hypoxemic resp. drive

2> High O_2 given can cause release of CO_2 from RBC
↳ HALDANE EFFECT.

IOC :- HRCT Chest

EOSINOPHILIC LUNG DISEASES

[Peripheral eosinophilia + Lung infilterates]

CLASSIFICATION

Unknown cause	Known cause
1) Acute eosinophilic pneumonia	1> PARASITIC INFESTATIONS (Nematods)
2) Chronic " "	Loeffler's pneumonia
3) Hypereosinophilic syndrome	2) ABPA
4> Churg strauss Sx	3) Drugs :- Nitrofurantoin, sulfonamides, Isoniazid, Pencillamine

Hypereosinophilic Syndrome -
Persistent (6 months) eosinophilia > 1500/mm^3.
& end organ infilteration.

CHARACTER	Ac. EP	Chr. E. P.
Smoking H/o	+++, new onset smokers	±
Asthma H/o	--	++
CF - Radiology	Acute shortness of Breath + Hypoxemia + B/L diffuse infilterates.	Cough + wheeze. Peripheral opacities
Peripheral eosinophilia	Initially not seen but seen during later course of disease	Usually seen

	AEP	CEP
BAL eosinophilia	BAL > 25% eosinophil	BAL > 40% eosinophil
Rx	steroid	steroid

ASPERGILLUS & LUNG

I> HYPERSENSITIVITY RXN. → DOC :- steroid

Type I ↓ Asthma

Type I', III, IV ↓ ABPA

II> PNEUMONIA IN IMMUNOCOMPROMISED → DOC :- VORICONAZOLE.

= Invasive Aspergillosis

Transbronchial angioinvasion. → may develop hemoptysis
· Fever + SOB.

DOC for (I) & (IV) ⇒ STEROID.

DOC for (II) ⇒ VORICONAZOLE

III> COLONISATION IN PREXISTING LUNG CAVITY

Aspergilloma / Fungall BALL

CXR → 1) Air crescent Sign.
2) Ball changing its position :- decubitus.

Rx - Resection if pt. is symptomatic

CRITERIA FOR ABPA

1) Predisposing cond^{n} - ✓Asthma
✓Cystic Fibrosis

2) Peripheral **Eosinophilia**

3) S. IgE → **> 1000 IU**

4) Aspergillus specific IgE & IgG will be +nt

5) Skin test +ve **aspergillus fumigatus.**

6) CxR - **fleeting opacities** → upper zone

7) Central (or) Proximal **B' XIs**.

Doc:- Systemic steroids.

CT chest -
- ✓Finger in glove
- ✓Toothpaste

HYPERSENSITIVITY PNEUMONITIS
or Extrinsic Allergic Alveolitis

Type III + IV HSN

S. IgE → (N)

No. peripheral eosinophilia

BIOPSY → non caseating granuloma + cellular bronchiolitis + Interstitial inflammation.

Eg:

DISEASE	EXPOSURE	ANTIGEN
1) Farmar's Lung	Moldy hay	Micropolyspora fen: (Thermoactenomyces Sacchari: Thermo actino myeter)
2) Bagassosis	Sugarcane dust	
3) Bird fancier Lung	Pigeon excreta	Avian protein
4) Malt warker Lung	Mouldy Barley	Asp. clavatus
5) Hot tab lung	Contaminated water	Non-Tuberculer mycobacterium

Astic CRITERIA :-

1) Exposure to known antigens
2) Presence of serum precipitins against offending Ag.
3) Occurence of symptoms in 4-6 hrs of exposure
4) Reoccurence of symptoms on exposure
5) Inspiratory crepitation.
6) wt. loss

TYPES

	CT Chest
ACUTE - hours to days	Ground glass opacities
SUBACUTE - week.	Centrilobular nodules
CHRONIC - Month	Fibrosis (upper zone)

Rx - Most Important → Avoidance of allergen
Systemic steroids

ILD

Def":- Group of Disorders characterised by predominant involvement of interstitium progressing to fibrosis & vary in mechanism & magnitude.

ETIOLOGY:-

I> Inhalational ILD

- Organic Dust → Hypersensitivity Pneumonitis
- Inorganic Dust → Silica, Asbestosis

II> Drugs / Radiotherapy
- Amiodarone
- Methotrexate
- Busulfan

III> Connective Tissue Disorder
- Scleroderma
- RA
- SLE

IV> IBDs

V> Infections - TB

VI> Malignancy

VII> Sarcoidosis

VIII> Idiopathic

PATHOLOGICAL PATTERNS:-

1> Usual Interstitial Pneumonia (UIP)

2> Non-specific " " (NSIP)

3> Acute Interstitial Pneumonia (AIP)

4) Cryptogenic Organising pneumonia (COP)

5) Respiratory Bronchiolitis (RBILD)

6) Desquamative Interstitial Pneumonia (DIP)

7) Lymphocytic " " (LIP)

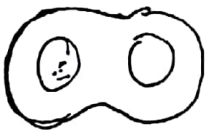
IOC :. ~~CT~~ HRCT chest

Confirmatory Test :. Surgical Lung Biopsy

RADIOLOGIC PATTERNS

Reticular Pattern.

CT Chest



Mild opacity = Ground Glass opacity

Used density = consolidation.

	Usual Interstitial Pneumonia	NSIP. (H/c form of connective tissue disorder associated ILD)
M/C form	or Idiopathic Pul. Fibrosis	
C/F.	50-60yrs ♂ > ♀, Smoker. insidious, Auscultation - Inspiratory crepts. Exam - clubbing	40-50yrs ♀ > ♂ Non-smoker, subacute onset.
Biopsy	Heterogeneous involvement Fibroblastic foci	No fibroblastic foci Lymphocytic inflammation
Radiology	- B/L Lower zone & - subpleural involvement - Minimal Ground glass opacity - Significant Traction B'XIS - Honeycombing	B/L ground glass opacities Minimal Traction Bronchiectasis Rare honeycombing
Rx + Prognosis	Poor response oo Pirfenidone Nintedanib	Good response. ī oo steroid

ACUTE INTERSTITIAL PNEUMONIA / HAMMAR RICH SYNDROME

Pt- present ī acute SOB + Hypoxemia + Diffuse infiltrate

Idiopathic ARDS

Rx- supportive. High mortality

CRYPTOGENIC ORGANISING PNEUMONIA / BRONCHIOLITIS OBLITERANS ORGANISING PNEUMONIA (BOOP)

1) Pneumonia like illness
2) Proliferation of granulation tissue in airway ⇒ MAISON BODIES

3) Presence of Interstial infilterate.

CXR :- B/L Peripheral Consolidation.

Rx :- STEROID.

SMOKING AND ILD:

Resp. Bronchiolitis associated ILD

Desquamative Interstitial Pneumonia

Adult Pulmonary Langerhans cell histocytosis

Acute eosinophilic pneumonia

Pulmonary heamorrhage syndromes

Idiopathic pulmonary fibrosis

ILD: Less Prevalent In Smokers :-

1) Sarcoidosis

2) Hypersensitivity pneumonitis

SARCOIDOSIS

Multisystem Disorder characterised by non-caseating Granuloma.

Etiology :- 1) Autoimmune

2) Propionibacterium

3) Mycobacterium

4) unknown.

5) Genetic susptibilty - HLA DRB, 1101

M/C → Pul. Involvement.

Scadding Staging I- Hilar adenopathy 

II- " LN↑ + Lung infilterates 

III- Lung infilterates alone 

IV- Fibrosis 

Upper zone predominant Disease

PHENOTYPES

1> LUPUS PERINIO-

Cutaneous involvement → Bridge of nose
area beneath eyes + cheeks

2> LOFGREN SYNDROME-

Erythema nodosum, Hilar LN↑
Uveitis (MC - Anterior), Arthritis

3> UVEO-PAROTID FEVER

Uveitis + Parotiditis + Fever + CN 7th Palsy

Δ:-

1> (IG) → release ACE. + $1,25(OH)_2$ Vit D

Non-caseating granuloma → ↑S.ACE >2times (N)

$1,25(OH)_2$ Vit D → Hypercalcemia

2> Blood :- Peripheral Lymphopenia - sequestration of lymphocytes into lung

3> Bronchoscopy :-

BAL - Lymphocytes $\frac{CD4}{CD8}$ ↑

4> Biopsy - Non-caseating granuloma

IOC → Incompatible clinical scenario → Biopsy of involved organ showing non-caseating granuloma is s/o Sarcoidosis

5) CT chest → Lung infiltrates
LN ↑

In TB LN → Caseating ⇒ Central hypodensity ± peripheral rim enhancement

Sarcoidosis → uniform density

6) Gallium scan

a) ↑ uptake by Parotid + Lacrimal gland - b) ↑ uptake by mediastinal LN

"PANDA SIGN"

"LAMBA SIGN"

℞ Steroid + Immunosuppressor.

↑ LEVELS OF ACE

1) Sarcoidosis
2) Leprosy
3) Gaucher's Disease
4) Hyperthyroidism
5) Disseminated granulomatous infec such as
6) miliary TB

Pneumonic: [Sar Le Ga DM ~~Hyper wo~~ thyro wale]

CONNECTIVE TISSUE DISORDER & LUNG

RA

M/c pulmonary manifestation → pleuritis

Low Glucose Pleural Effusion

ILD → NSIP, B'xis

Rheumatoid ~~Arthritis~~ nodule

CAPLAN's Syndrome. [RA + Pneumoconiosis] [silica expo, coal expo]

SLE

M/c pul. manifestation = Pleuritis

Acute lupus pneumonitis.
⇒ Pulmonary capillaritis + Deffuse alveolar H'ge

ILD → NSIP.

Shrinking Lung Syndrome

Diaphragmatic involvement in SLE.

SCLERODERMA

HIDE BOUND CHEST.

ILD NSIP ⟶ UIP, Pul. HTN

MCC of death in scleroderma → Pulmonary cause

POLYMYOSITIS

↑ Anti JO1 ABS (

→ Anti Synthetase Sx.

→ C/F – 1) Fever
2) Myositis
3) ILD
4) Arthritis
5) Mechanic Hands

DIFFUSE ALVEOLAR Hge / Pul HEMOSIDEROSIS

IDIOPATHIC Pul. hemosiderosis

1) Intra alveolar bleed
2) Fe accumulation as hemosiderin in alveolar macrophages
3) Fe deficiency anaemia

Pul. RENAL SYNDROME

1) SLE.
2) Good Pasture Syndrome
3) Small vessel vasculetis
   - Wegener's granulomatosis.
     1) Necrotising granulomatous vasculitis
     2) RPGN
     3) necrotising involvement of
        - URT → Epistaxie, sinusitis
        - LRT → Cavities, Diff. Alv. Hge

OCCUPATIONAL LUNG DISEASES

SILICOSIS

H/C occupational Lung Disease worldwide

< 2.5 μ = Dangerous particles

ASBESTOSIS

occupation Ship building, Construc° worker

Particle ~~ curvy serpentine
>> straight amphibole (carcinogenic)

FEATURES

1) Pleural Plaques
   - Most specific for asbestosis
2) Fibrosis
   - ∝ duration & exposure

SILICOSIS

Sand blasting, quarying

crystalline silica
Amorphous silica
1) Silicotic nodules

2) Merging of nodules → progressive massive fibrosis

COAL-WORKERS PNEUMOCONIOSIS

Coal miners

~~Anthracite~~ ~~Bituminous~~

1) ~~Anthracosis~~
   1) Anthracite
   2) Bituminous
2) Anthracosis
3) Coal macules
3) complicated CWP
4) ↑ COPD

3) Benign pleural effusion.

4) M/c malignancy associated c it
⇓
LUNG CANCER
Smoking + asbestosis.
⇒ synergistic

Most specific
↳ MESOTHELIOMA

Lower zone Disease

Round Atelectasis

Organised Pleff. around segment
↓
Localised atelectasis
⇓
COMET TAIL appearance

3) Silico-TB:- Chronic exposure

4) Alveolar proteinosis
↳ acute exposure

5) Malignancy.
CXR - Hilar LN + egg shell calcification

Upper zone Disease

5) Malignancy

SLEEP APNOEA

Apnoea - Cessation of airflow for atleast 10 sec.

Hypopnoea - >30% reduction in airflow associated c
>3% fall in SpO_2.

SLEEP APNOEA

CENTRAL

Resp. effort ⊖

Apnoea ⊕

Resp. drive ⊖

eg CHF

Narcotic Abuse

OBSTRUCTIVE

Apnoea ⊕

Persisting Resp. effort

↑ collapsibility of airway at Neck.

R/F for obstructive Sleep Apnoea :-

1) obesity
2) ♂
3) Craniofacial Ab Ⓝ
4) Hypothyroidism
5) Alcoholism

PATHOPHYSIOLOGY-

H/C Symptom → Snoring.

APNOEA → HYPOXEMIA → Pul. HTN, & Cor Pulmonale

↓

Arousal

↓

↑ Catecholamine Surg

↑ daytime sleepiness, Loss of interest, Depression, Personality changes, RTA ← Loss of quality of sleep

Uncontrolled HTN & Poor glycemic control

CAD, MI, arrhythmia, Sudden cardiac death, CVA.

Gold Std Δ :- Polysomnography

1) EEG
2) EOG
3) ECG
4) EMG
5) SpO_2.
6) Oronasal flow
7) Snoremic
8) Thorax & Abd. movement sensor
9) Body position / Limb movement

Other scales for assesment :-

1) Epworth sleepiness scale
2) STOP BANG Questionaire.

SEVERITY of OSA ⇒ APNOEA HYPOPNEA INDEX (AHI)

$$\frac{\text{No. of Apnoea + Hypopnoea}}{\text{Hour.}}$$

< 5/hr ⇒ (N)

5-14/hr ⇒ Mild OSA → Behavioural Rx

15-29/hr ⇒ Mod. OSA
≥ 30/hr ⇒ Severe OSA
→ Medical Rx of choice
CPAP – mild OSA + Commorbidities

In few case → Uvulo palatopharyngo plasty.

MALIGNANCY

1° LUNG MALIGNANCY :-

- Non-Small Cell Lung Cancer (NSCLC)
  1) Adeno Ca M/C worldwide
  2) Sq. cell Carcinoma MC in India
  3) Large cell "
- Small cell Lung Cancer (SCLCC)
  1) Small cell Ca / Oat cell tumour.

LOCATION & ASSOCIATION OF TUMOURS :-

1) Central Location & Cigerette smoking

⇒ Sq. cell & small cell (strongest association)
Endobronchial Location.

2) Peripheral location & Less ~~me~~ smoking

Adeno Ca (♀, young ♂, Less smoker) & Large cell

3) Cavitation

Squamous & Large.

	ADENO	SQUAMOUS	SMALL CELL
Oncogene	KRAS / EGFR / ALK	FGFR, PI3K	myc, Bcl225
Biopsy	Glandular differentiation	Keratinisation + intercellular keratin bridges	Small round cell ī hyperchromatic nuclei
Features	→ Lepidic pattern	Central	(B) chemo & radio sensitive
	Lung → Lung metastasis	Cigarette	Rapid recurrence
	Scar Ca → Adeno ca (M/c ca in abbestosis)	Cavity	↑ metastasis
		Calcemia	↑ SVC obstruc"
	↑ Clubbing → Hypertrophic osteoarthropathy	~~Hypo~~ Life threatening	POOR PROGNOSIS
	Paraneoplastic ↳ Hematologic	↑ parathormone related peptid	↑ Paraneoplastic Syndromes

PARANEOPLASTIC associated ī S'CLC

M/cc of ectopic ACTH ↓ SCLC.

1) Hyponatremia – SIADH
2) Hypokalemia – ectopic ACTH
3) Hypocalcemia – Calcitonin
4) Lambert Eaton Syndrome

CLINICAL MANIFESTATIONS of SCLC

1) Irritation → Cough (M/c symptom)
2) Hemoptysis – tumour infilterates vessel
3) ↑ size & causes → Bronchial obstruc" (Fever, SOB)
4) Pleural involvement ⇒ Pleuritis
Chest pain, Pleural eff → SOB

5) Skin & Intercostal n/vs. → Chest pain.

6) Pericarditis / Pericardial effusion.

7) Esophagus → dysphagia

8) Recurrent Laryngeal n/v → Hoarseness of voice

9) SVC obstruction.

10) Stellate Ganglion → HORNER's Syndrome
(sympathetic ganglion)

↓

- Anhydrosis
- Miosis
- Ptosis
- Loss of ciliospinal reflex
- Enophthalmos

Migratory thrombophlebitis
= Trousseau's Syndrome
+ clubbing = Adeno Ca

11) Distant Metastasis :· Brain / Bone / Liver.

H/C site → Brain

Most specific → Adrenals.

INVESTIGATIONS :-

1) CYTOLOGY → Sputum, Pleural fluid } malignant cells

2) CXR - PA - Solitary Pulm. nodule
Collapse
LN ↑
Pleural Eff

3) CT - Chest - Precise anatomical Location.

4) Gold Std → BIOPSY < CT guided
Bronchoscopy

5> PET SCAN - staging

6> Bone Scan

Rx

- NSCLC
  - Resectable
    - Stage I, II, IIIA
      - ↓
      - Surgery
  - Unresectable
    - IIIB, IV
      - ↓
      - Medical Rx
        - Squamous
          - ↓
          - Cisplatin + Gemcitabine/Paclitaxel
        - Adeno
          - ↓
          - Cisplatin + Pembrexed.
          - Targeted Rx
            - ↓
            - EGFR Antagonist - Erlotinib, gefotinib
            - ALK Antagonist Crizofinib.
- SCLC
  - ↓
  - Medical Rx
    - Chemo Rx + Radio Rx.
      - ↓
      - Cisplatin + Etoposide

Adeno Ca/ ♀/ non-smoker/ Asian ⇒ EGFR mutation.

Pancoast Tx - usually occurs ε Sq cell
Located at apex.
May involve stellate ganglion.

PANCOAST SYNDROME = 1> Tumour in Lung APex
2> Involve → 1st 2 ribs
→ Stellate Ganglion.
→ $C_8 T_1 T_2$ → Pain, weakness in Ulnar distribution

TUBERCULOSIS

Tabes

NOMENCLATURE

Tabes Pulmonale - Pul. TB (M/C)

Tabes mesentrica - Abd. TB

Carries sicca - Shoulder TB

Potts Disease - Spinal TB

Spina ventosa - TB Dactylitis

Scrofula - LN TB (M/c extrapulmonary)

Lupus vulgaris - Skin TB

Poncet Disease - TB Rheumatism

ORGANISM & LAB DIAGNOSIS

1> Direct Microscopy → ZN staining / Led FM

Under ZN staining to visualize each mL of sputum should contain 10,000 bacilli

2> Solid Culture → LJ media 6-8 week

3> Liquid ,, → BACTEC
MGIT
Septi check
} ~~6-8 week~~ 7-10 day +ve result

4> Rapid Molecular Method

a> CBNAAT → / Gene expert → TB Bacilli + Rif. sensitivity 2 hours.

b> Line probe assay / LPA → TB Bacilli + Drug sensitivity (1st Line & 2nd Line drug) = 48-72 hour

Most Rapid method to identify of TB → Direct microscopy

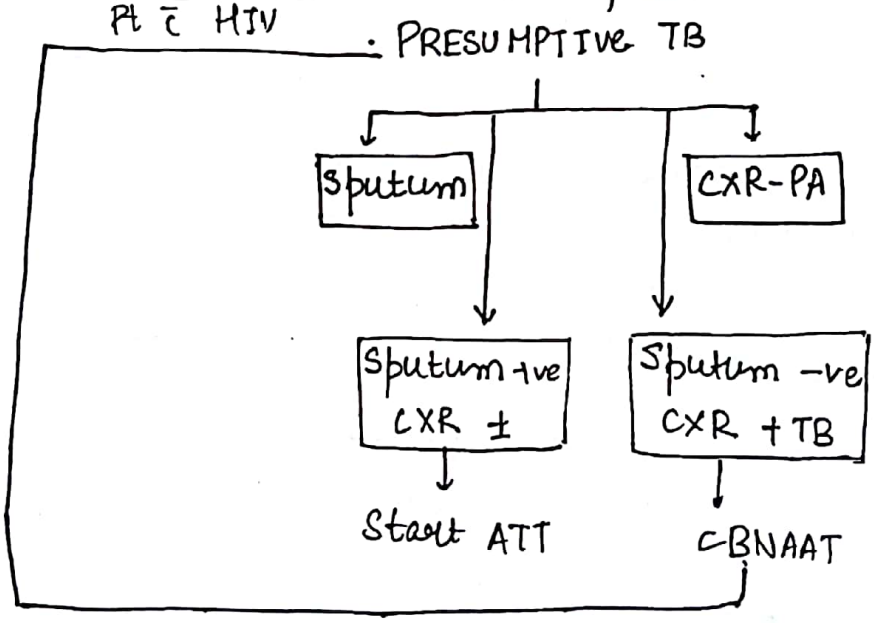
Most Rapid method for Rifampicin sensitivity = Gene expert

PRESUMPTIVE TB

Any one of the following

- Cough > 2 wks
- Fever > 2 weeks
- Hemoptysis
- wt. loss
- Abnormalities on CXR - PA view

ALGORITHM FOR Δ of TB



IGRA / Quantiferon Gold

Advantages :-

1> TB specific Ag → CFP & ESAT used

2> Less cross-reactivity c BCG & Non Tubercular mycobacterium

3> Blood Test

4> Serial Testing can be done c out boosting phenomena

5> Single visit to hospital.

Disadvantage

Can't differentiate Infection vs Active disease

PATHOLOGY

1° TB → unsensitised individual

2° TB → Post 1° TB → sensitised individual → Reinfection / Reactivation

1° TB

→ TB bacilli → mid + lower zone

→ Area of 1st contact

1° focus / Ghon's focus

→ Alveolar macrophage engulf TB bacilli

↓

⊖ Phagolysosome fusion

↓

↑ survival of M.tb.

→ For immunity macrophages reach hilar LN ⇒ LN ↑

Ghon's complex → Ghon's focus + LN ↑.

In LN →

↑ TH_1 response

* ↑ IFN-γ , TNFα

⇓

↑ Killing capacity of macrophage

↓

Limit TB

Memory cells are formed

2° TB

→ TB bacilli reach apex & actively grow.

→ Bodys immune response will try to wall off infection.

→ After few weeks, Delayed Type HSN response produced & destroys TB bacilli & Lung Parenchyma

2° TB is more infectious & it is active disease.

Calcified Ghon's Complex ⇒ Reinke's complex.

TB/HIV

* If ART is started 1st → ↑ Risk of immune Reconstitution Inflammatory syndrome (IRIS)

Start ATT 1st & merge ART in 2 weeks. to 2 months

ATT = Always The Treatment

* If pt. is on TLE regimen. → Rifampicin can be given

If pt. is on Neviparine / Protease Inhibitor

↓

Rifampicin can't be given

Rifabutin is given.

~~DISSEI~~

DISSEMINATED TB

CLASSICAL MILIARY TB	CRYPTIC MILIARY TB
1°/2° form Hematogenous / Lymphogenous spread. Pathognomic ⇒ Choroidal Tubercles Sputum → -ve CXR - 1-2mm, Bil Symmetric Homogeneous, millet shaped shadowing	Elderly, chr. symptom Fever, wt. loss, anaemia CXR - (N) Sputum → -ve Pt. collapses ⇒ death ∴ autopsy reveals meningeal tubercles This is also miliary TB. but hidden one CXR.

NON-REACTIVE (or) AREACTIVE TB

Rare form

Acute Septicaemic form.

Underlying hematological abnormality

Fatal form

Autopsy shows areas of necrosis ± out granuloma formation

Rx

New Case = 2HRZE + 4HRE = 6 months = DAILY

Previously Rx: 2HRZES + 1HRZE + 5HRE = 8 month = DAILY

HDR TB = Resistance to both H & R = DAILY

6-9 mnth → E + Z + Kanamycin + Levoflox + Cycloserine + Ethionamide

18 mnth → E + Levoflox + Cycloserine + Ethionamide

XDR-TB :- MDR-TB + Resistance to 1 2nd Line aminoglycosid + Resistance to 1 FQ

6-12 mnth - Capreomycin + Moxi + PAS + Clofazamine + High dose INH + Amoxyclav + Linezolid

18 months - Moxi + PAS + Clofazimine + High Dose INH + Amoxyclav + Linezolid

(24 - 30 months)

NEWER Anti-TB Drugs

BEDAQUILINE / Sirturo

2012

Diaryl quinolone

MOA:- ATP synthase inhibition

S/E - QT Prolongation

DR TB.

Conditional acces in India

DELAMANID

2014

Nitroimidazole

MOA:- Mycolic acid synthase inhibitor

S/E - QT Prolongation

DRTB

Soon available in India

Dose - 400mg

duration - 24 weeks.

ACID, BASE, BALANCE & ABG

I) NORMAL VALUES

pH	7.35 - 7.45
$PaCO_2$	35 - 40 mmHg
HCO_3^-	22 - 26 meq
PaO_2	70 - 100 mmHg

$pH \leq 7.35 \Rightarrow$ Acidosis

$pH \geq 7.45 \Rightarrow$ Alkalosis

(N) $PaCO_2 = 40$

$HCO_3^- = 26$.

II) Relation Between pH, $PaCO_2$ & HCO_3^-

↳ Henderson Hasselbach Equation

$$pH = 6.1 + \log \frac{[HCO_3^-]}{PaCO_2 \times 0.03} \Rightarrow pH \propto \frac{HCO_3^-}{PaCO_2}$$

$$\downarrow pH \uparrow \propto \frac{HCO_3 \uparrow}{PaCO_2 \uparrow} \Rightarrow \frac{BASE}{ACID}.$$

III) REGULATION OF PH $PaCO_2$ & HCO_3^-

Lungs ↑↓ CO_2 ⇒ Resp. process

Kidneys ↑↓ HCO_3^- ⇒ Met. process

SIMPLE ACID BASE DISORDER

1° process + Adequate compensatory response

Respiratory Acidosis

pH↓ $PaCO_2$↑ HCO_3^-↑

Metabolic Acidosis

pH↓ $PaCO_2$↓ HCO_3↓

Resp. Alkalosis

pH↑ $PaCO_2$↓ HCO_3^-↓

Metabolic alkalosis

pH↑ $PaCO_2$↑ HCO_3^-↑

In simple acid base disorder, always 1° change & compensation move together

In 1° resp. process → change in pH w.r.t. $PaCO_2$ & HCO_3^- in opposite direc"

In 1° met. process – change in pH w.r.t $PaCO_3$ & HCO_3^- in same direction

ROME

resp. opp, met. same direction.

Q. pH = 7.33, $PaCO_2$ 60, HCO_3^- 34
↓ ↑ ↑ ⇒ Resp. Acidosis
acidosis

Q pH = 7.48, $PaCO_2$ 26 HCO_3 16
↑ ↓ ↓ ⇒ Resp. Alkalosis
alkalosis

Q. pH = 7.27, $PaCO_2$ 25 HCO_3^- 10
↕ ↓ ↓ ⇒ Met. Acidosis

Q pH = 7.55 $PaCO_2$ 50 HCO_3^- 40
↑ ↑ ↑ ⇒ Met. Alkalosis

COMPENSATION

Resp. Acidosis

Acute For every 10mmHg ↑ $PaCO_2$, HCO_3^- ↑ by 1 meq.

Chronic For every 10mmHg ↑ $PaCO_2$, HCO_3^- ↑ by 4meq

Resp. Alkalosis

Acute For every 10mmHg ↓ $PaCO_2$, HCO_3^- ↓ by 2 meq

Chronic " " 10mmHg ↓ $PaCO_2$ HCO_3^- ↓ by 4meq

Q Acute F.B. ingestion, pH = 7.32, $PaCO_3$ = 70, HCO_3^- - 29.

↓ ↓ ↑ ↑

Acidosis Acidosis.

$40 \xrightarrow{30} 70$ $26 \xrightarrow{3} 29$.

Resp. acidosis ~~complemen~~ compensatory met. alkalosis

Q Chr. neuromuscular disorder

pH = 7.34 $PaCO_2$ = 60 HCO_3^- 34

↓ ↑ ↑

chr resp. acidosis

$40 \xrightarrow{20} 60$ $26 \xrightarrow{8} 34$

ans:- Chr. resp. acidosis ~ compensatory met. alkalosis.

Chr. compensated Resp. Acidosis.

Metabolic Acidosis

Acute expected $PaCO_2 = (1.5 \times HCO_3^-) + 8 \pm 2$. [Winter's formula]

Q. pH = 7.27, HCO_3^- = 10, $PaCO_2$ = ?

$(1.5 \times 10) + 8 \pm 2$

$15 + 8 \pm 2$

21 - 25 ⇒ compensated

Q. pH = 7.26, $PaCO_2$ = 18, HCO_3^- = 6?

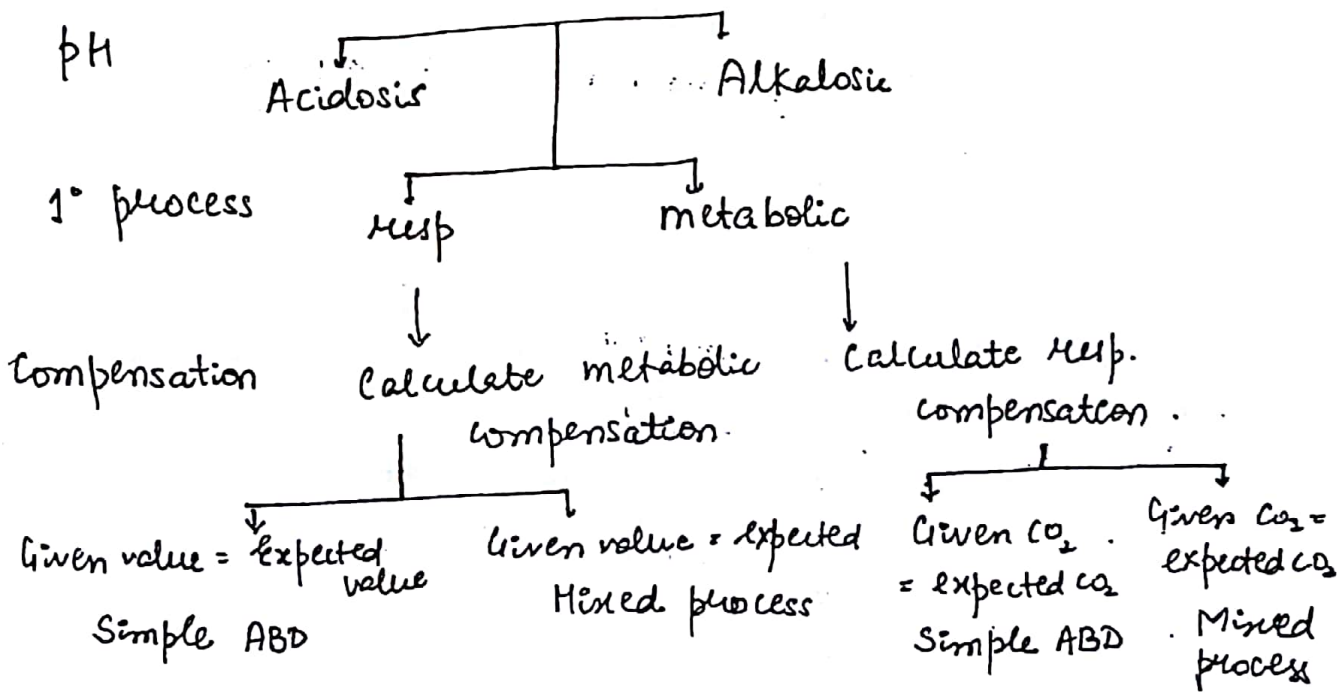
$(1.5 \times 6) + 8 \pm 2$ = ~~9 ± 2~~ ~~26~~ ~~7 - 11~~.

$9 + 8 \pm 2$ = 17 ± 2 = 15 - 19.

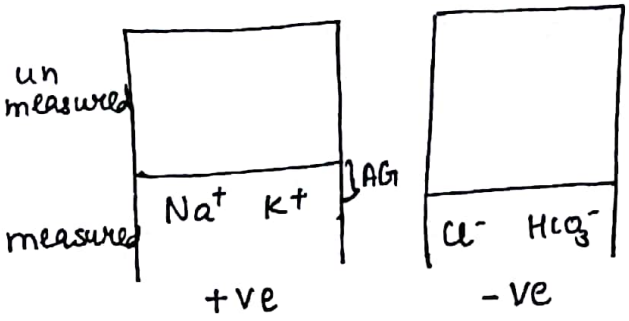
Met. acidosis + compensatory alkalosis

Metabolic Alkalosis

Expected $PaCO_2 = [HCO_3^- + 15]$



METABOLIC ACIDOSIS & CONCEPT OF ANION GAP



$(Na^+ + K^+) - (Cl^- + HCO_3^-)$ = Anion Gap.

$(Na^+ + K^+)$ + unmeased cations = $(Cl^- + HCO_3^-)$ + unmeasured anions

$(Na^+ + K^+) - (Cl^- + HCO_3^-)$ = unmeasured anions − unmeasured cations

[Anion Gap] = unmeasured anions − unmeasured cations

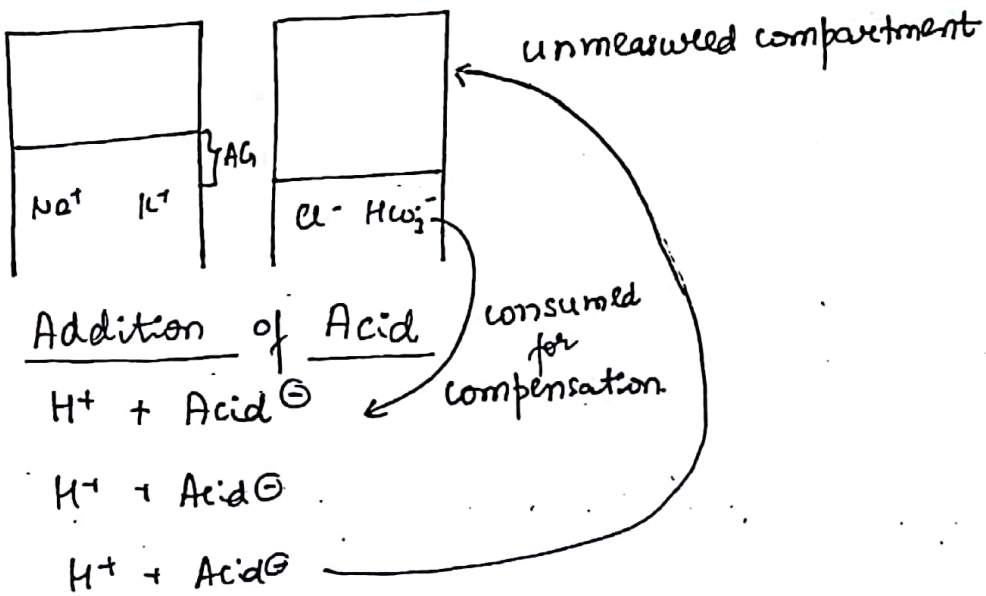
Common cause of ↑ in Anion Gap = ↑ in unmeasured anions

New Formula for Anion Gap

$(Na^+) - (Cl^- + HCO_3^-)$ = AG

8-12 mEq.

HIGH AG METABOLIC ACIDOSIS



In pure High AG Metabolic Acidosis

Rise in AG = fall in HCO_3^-

AG - 10 = 25 - Given carbonate.

$\Delta AG = \Delta HCO_3^-$

CAUSES :-

I) TOXINS / DRUGS - 1) Methanol

2) Paraldehyde

3) Ethylene glycol. / antifreeze
↳ oxalic acid.
Oxaluria

4) Salicylates.

II) Keto acidosis - 1) DKA

2) Alcoholic keto acidosis

3) Starvatation

III) Renal Failure

IV) Lactic Acidosis

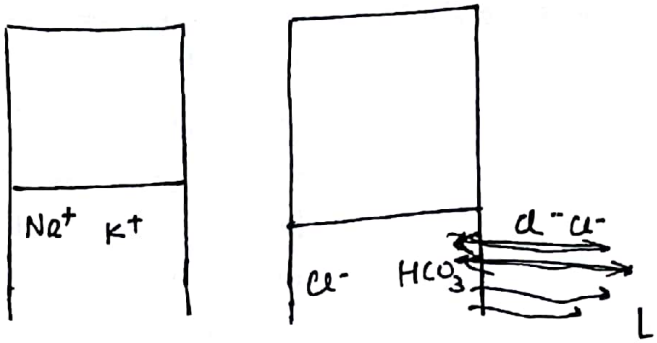
a) Type A Lactic Acidosis ⇒ [Hypoxemia / ↓ perfusion]

eg. shock
Anaemia
CO poisoning

b) Type B Lactic Acidosis = [Perfusion ⓝ]

eg. Renal failure
Hepatic failure
Drugs - metformin
Zidovudine

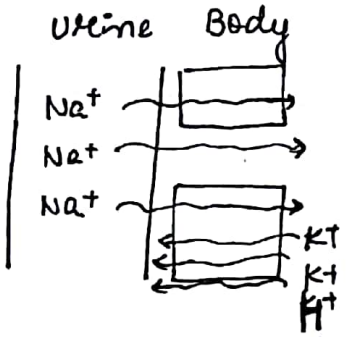
(N) AG METABOLIC ACIDOSIS



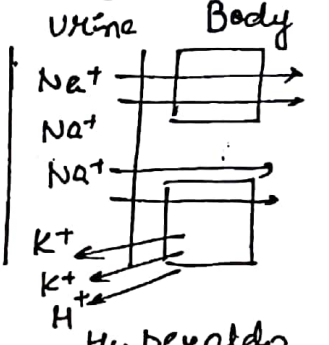
Loss of HCO_3^-

Hyperchloremic Metabolic Acidosis

RENIN - Angiotensin - Aldosterone System in Acid. Base



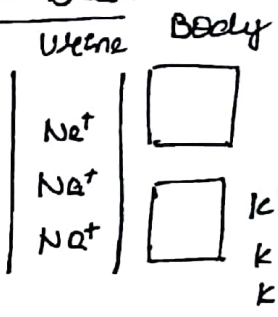
(N)



↑ RAAS

Hyperaldosteronism

Hypokalemia + Met. alkalosis



⊖ RAAS

Hypoaldosterone

Hyperkalemia + Met. acidosis

CAUSES

I) GIT CAUSE

1) Diarrhoea
2) Pancreatic fistula
3) Ureterosigmoidostomy
4) Enterocutaneous fistula

II) RENAL CAUSE

1) RTA
2) Drugs
   - (a) Carbonic anhydrase inhibitor
   - (b) ACEI
   - (c) ARB
   - (d) Aldosterone antagonist

RTA

Type I RTA Type II RTA Type IV RTA

Met. acidosis + hypokalemia

met. acidosis + Hyperkalemia (H/c type)

Causes

Hyporenemic state

Aldosterone resistance

" deficiency

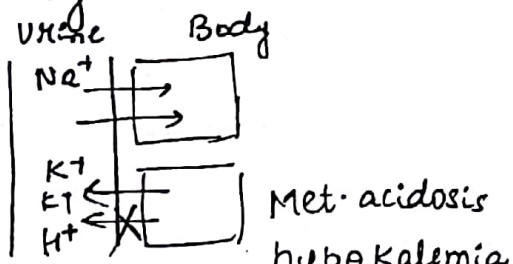
Hyporenemic state

↳ Diabetic nephropathy

Chr. tubulo interstitial

Type I RTA

- Distal RTA
- H^+ excretion Lost at collecting Duct

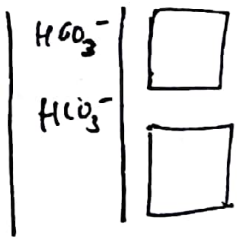


Met. acidosis
hypokalemia

Type II RTA

Proximal RTA

HCO_3^- reabsorption lost in PCT



Bicarbonaturia can induce Kalliuresis

Met. acidosis + Hypokalemia

Urine anion Gap :-

To differentiate (N) anion gap Met acidosis of diarrhoea v/s RTA

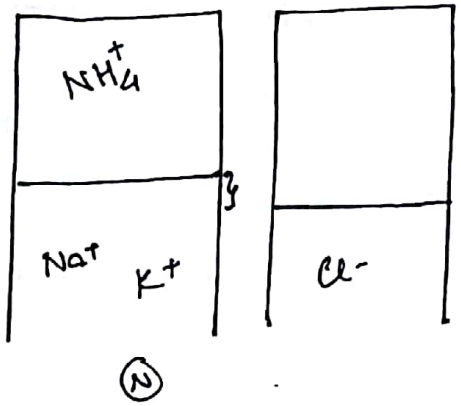
$$UAG = [Na^+ + K^+] - Cl^-$$

(N) value = 0-5.

---- | +++

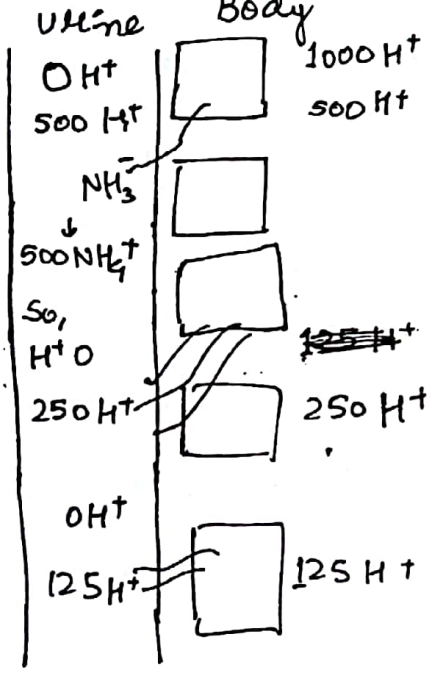
↓ | ↑

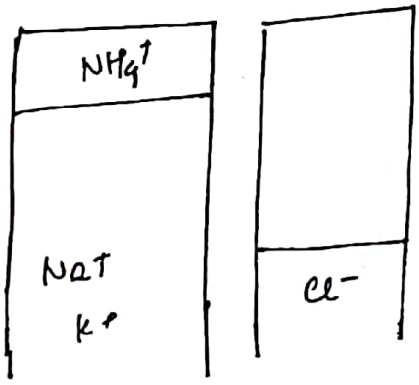
taking 0 as reference level



(N)

Renal Handling of Acid



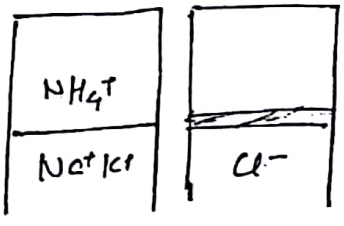


RTA = UAG +ve.

Diarrhoea :- Met. acidosis.

10,000 H+

Urinary NH_4^+ is increased.



UAG --ve

RTA :-

UAG is indirect measure of urinary NH_4^+ excretion.

UAG is negitive in GIT cause diarrhoea

GIT

METABOLIC ALKALOSIS

Initiating event	Persisting event
1) ECFV contraction, hypotension	2° Hyperaldosteronism
2) ↑ 1° mineralocorticoid excess	⟶ ECFV expansion & HTN
(B) initiating + persisting event)	

SALINE RESPONSIVE / Cl^- response	SALINE UNRESPONSIVE / Cl^- unresponsive
U_{Cl^-} < 20 meq	UCl^- > 20 mEq
1) vomiting	1) 1° Hyperaldosteronism — HTN
2) Ryle's Tube aspiration	2) Cushing's Syndrome — HTN
3) Diuretic use	3) Renin secreting Tumour — HTN
4) Post hypercapnic Met. alkalosis	4) Renal artery stenosis — HTN
	5) Liddle's Syndrome — HTN
	6) Bartter Syndrome — hypo to (N) tension
	7) Gitelman Syndrome — hypo to (N) tension

RESPIRATORY ACIDOSIS

Type 2 Resp. Failure

RESPIRATORY ALKALOSIS

CHRONIC Resp. Alkalosis :

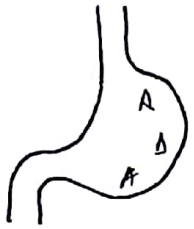
M/c acid Base Ab(N) in critically ill pt

1) Pain, Panic, Psychogenic, Progesterone
⇒ Hyperventilation

2) Aspirin
a) vomiting → met. ~~acidosis~~ alkalosis

2) High AG metabolic acidosis. → Resp. alkalosis.

→ When aspirin goes to blood



3) Theophylline

4) Fever, sepsis (change in sensitivity of Resp. centre)

5) CHF → Pul. oedema → stimulate of chemoreceptors

6) Cirrhosis of Liver → ↑ Glutamate

7) Severe ~~Hypotension~~ Hypoxemia ⇒ hyperventilation.

8) ↑ ICP

ICU pts are also prone to Resp. alkalosis due to pain, panic, psychogenic

Q. pH = 7.32, $PaCO_2$ = 60, HCO_3^- : 34.
↓ ↑ ↑ = Chr. compensated Resp. Acidosis.
40 → 60 (20) 24 → 34 (10)

Q. pH. 7.35 $PaCO_2$ = 60 HCO_3^- 40.
↓ ↑ ↑ = Given value > Expected HCO_3^-
Chr. Resp. acidosis + Add. metabolic alkalosis

Q. pH 7.28 $PaCO_2$ = 60 HCO_3^- 26
↓ ↑ (N) Given value < Expected HCO_3^-
Chr. Resp. acidosis + Add. metabolic acidosis

AG High AG or Normal AG.

In pure High AGMA $\Delta AG = \Delta HCO_3^-$

Rise in AG = fall in HCO_3^-

[Given AG - 10] = [25 - Given HCO_3^-]

Q. Pt. is having DKA.

pts AG = 20 $HCO_3^- = 15$

$\Delta AG = 20 - 10$ $\Delta HCO_3^- = 25 - 15$

10 10

⇒ Pure HAG Met. Acidosis.

Q. Pt is DKA.

Pt. AG = 20 $HCO_3^- = 20$

$\Delta AG = 10$ $\Delta HCO_3 = 25 - 20 = 5$

$\Delta AG > \Delta HCO_3^-$ → Additional metabolic ~~acidosis~~ alkalosis

*High
~~Additional~~ AGMA + addition Met Alk

Q. DKA AG = 20 $HCO_3^- = 10$

ΔAG 20 - 10 $\Delta HCO_3^- = 25 - 10$

= 10 = 15

$\Delta AG < \Delta HCO_3^-$

High AGMA + (N) AG metabolic acidosis

Compare ΔAG & ΔHCO_3^- relation.

$\Delta AG = \Delta HCO_3^- \Rightarrow$ Pure HAGMA

If $\Delta AG > \Delta HCO_3^- \Rightarrow$ HAGMA + additional met. alkalosis

If $\Delta AG < \Delta HCO3^- \Rightarrow$ HAGMA + additional met acidosis

Q pH - 7.2 ↓ $PaCO_2$ - 60 ↑ HCO_2^- 19 ↓

~~Acidosis~~ Acidosis (mixed disturbance)

~~Q pH~~ 20.

NEPHROLOGY

PHYSIOLOGY

Kidney performs Diverse func" :-

1) Excretory :- urine formation

2) Homeostasis :- water & acid base balance

3) Hormonal :- erythropoietin synthesis & Vit D activation.

4) RENAL BLOOD FLOW

Kidneys are highly vascular.

Receives 25% of c.output

Even in presence of adverse cond" to the renal blood flow -

1) Dehydration

2) Hypotension

3) Renal artery stenosis

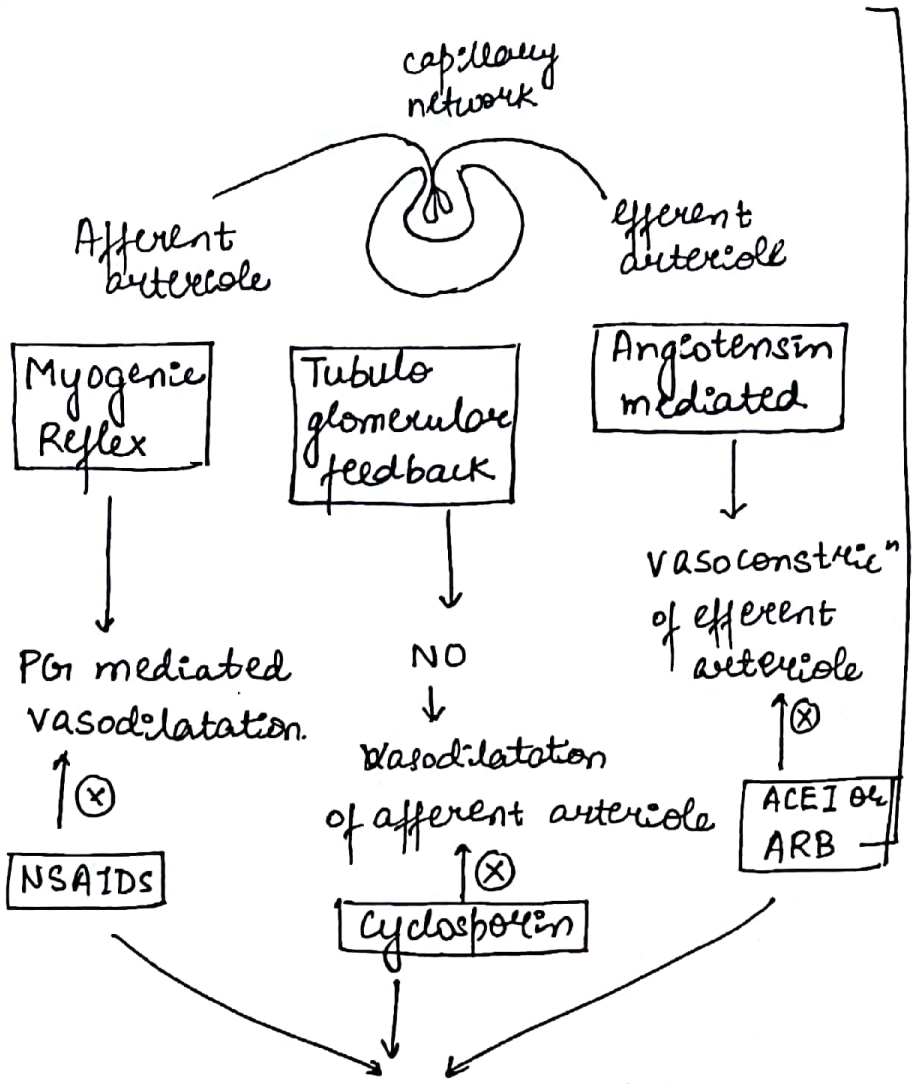
↓

Autoregulatory mechanisms activated

↓

Maintain adequate GFR.

1) ↑ Glomerular capillary Pressure



Can Disrupt autoregulation

If used in the presence of adverse ~~cond~~ conditions, these can precipitate hypoperfusion

⇓

Pre-Renal AKI

RENAL ARTERY STENOSIS

Cause → 1) 90% → atheros/arteriosclerosis

2) 10% → FMD (fibromuscular Dysplasia)

Pathophysiology →

Activates ~~the~~ RAAs

Vasoconstriction | Na^+/H_2O retension.

M/C C/F → Sy. HTN

[M/C cause - 2° HTN - Renovascular]

ESG GUIDELINES - evaluation & Management

When to suspect/ screen for R.A.S.?

1) young HTN (onset <30 yrs of age)
2) Severe HTN <55 yrs of age (>160/110 mm of Hg)
3) HTN emergencies (sudden ↑ BP ± target organ damage)
4) Refractory HTN (uncontrolled ≥3, 1 is a diuretic)
5) Decline in GFR ≥30% after ACEI therapy (Disrupts autoregulation)
6) Asymmetrical kidneys on USG (Diff. ≥ 1.5cm)
7) Unexplained Renal failure

Screening Tests	Specific
1) Duplex Doppler (Best) >98% sensitivity - Non-invasive, easy available	1) Conventional Renal angiography GRADING
2) CT-Renal Angiography ↓ C/I → GFR ≤60 mL/min	% of Stenosis: Severity & Rx <50% (Mild): No further testing 50-70% (Moderate): Follow-up >70% (severe): Always haemodynamically significant ↓ Elective Rx
3) MR-Renal angiography C/I → GFR ≤30 mL/min	
4) DTPA Scan (radio-isotope) (Functional assesment of Kidney)	

R_x 1st line → Medical

U/L	B/L
ACEI (only drug ≤ protects (N) Kidney)	ACEI - C/I CCB β blocker Diuretics

MOA of ACEI in U/L RAS.

ASSESSMENT METHODS IN NEPHROLOGY

S. CREATININE LEVELS (Best) screening Test)

C. PRODUCED	EXCRETED
endogeneously @ constant Rate By Protein Breakdown.	Freely filtered at glomerulus Barely secreted/ reabsorbed @ tubules

S creatinine α GFR

↓ GFR → ↑ S. creatinine level

Renal Dysfunc" — Early • sensitive marker

Limitations of Test

- nonspecific for Δ of nephropathy.
- may not co-relate immediate outcome of the disease (Limited Prognostic value)

FALSE +ve ↑ S. creatinine

↑ Produc"

a) High Protein Diet
b) strenous exercise. (athletes)

c) Infection (sepsis)
d) Inflammation (A.I.D.)
e) Neoplasms (some)

Alternative Test To S. creat

S. CYSTATIN - C LEVELS

Produced endogeneously By all nucleated cells @ constant Rate	Freely filtered @ glomerulus Excretion α GFR.

Adv - not related to Diet or Exercise

NOVEL MARKERS OF AKI. = Specific for Δ si of Nephropathy

NGAL (neutrophil gelatinase associated Lipocalcen)

KIM-1 (kidney Injury molecule)

IL-18

Tested in spot urine sample

Are secreted by tubules in response to injury.

Hence detectable only in Renal causes of AKI. (nephropathy)

TESTS - Detect :- SITE/ CAUSE/ SEVERITY

URINALYSIS | USG-KUB (structure) | GFR ESTIMATION. (functional status)

Proteinuria | Albuminuria | Hematuria | Pyuria | Cast/Sediment

PROTEINURIA

Defⁿ - >150 mg / 24 hours.

Detected using Dipstick Method (very sensitive)

- Non-specific for Δ si of Nephropathy
- Valuable in K/C/O - Nephropathy = identify SITE. (Based on quantity)

<2g/day (Tubular Range → Tubulointerstial Disorders	≥2g/d/1.73m² (Glomerular Range Proteinuria)	
	<3.5g/d	≥3.5g/d.
	Nephritic range	Nephrotic Range

ALBUMINURIA

>30mg/24hrs (More specific marker)

QUANTITATIVE TESTS	Micro-alb	Gross-alb
24hr urinary alb. estimation (most reliable / gold std)	30-300 mg of Alb/24hrs	>300mg
(Most Preferred) Spot urinary ACR (alb/creat. ratio)	30-300 mg of Alb/gm of creat	>300 mg
USE:- PROGNOSTIC ↓ Staging of CKI	- Early marker - Reversible stages DOC = ACEI	Late/Irreversible stages

Approach → HEMATURIA (RBC in urine)

Step 1 - Establish

"SIGNIFICANT" (any1)	"INSIGNIFICANT"
• >3-100 RBC/hpf ≥ 3 occassions • >100 RBC/hpf single occasion. • GROSS HEMATURIA	only observation. Repeat after 48hrs

- Renal T.B.

Inflammatory

1) Renal Calculi
2) **Papillary Necrosis**
(severe tubular necrosis)
vascular insufficiency - Mech.
↓
DM - analgesic abuse
Sickle - Kawasaki Disease
3) Post - Radiatherapy
4) Post - Transplant Rejection.

Approach :- CASTS / SEDIMENTS

Common CASTS But non-specific for Diagnosis

M/c cast in urine
HYALINE CAST
Most Benign cast
NO further Rx / test
↑
M/c found in AKI.

M/c cast in nephropathy
GRANULAR / CELLULAR
Present in Ⓑ
Tubulo-interstitia GN

RARE CASTS (10-15% cases)	DIAGNOSTIC
RBC cast	GN * (Acute GN)
WBC cast	Pyelonephritis
Muddy Brown Cast	Acute Tubular Necrosis
Eosinophilic Cast	Acute Interstitial Nephritis
Broad / waxy Cast ↑ WORST CAST	C.K.I.* Indicates total break down of tubules.

USG-KUB

(N)	Ab (N) & Its Interpretation
1> SITE :- Anatomical	ECTOPIC → NO relation to function
2> SIZE :- 7-11 cms < 7cm (Shrunken) CKI (exception) →	> 11 cms – Enlarged / Bulky AKI. → classical in acute Interstitial Nephritis Early DM nephropathy Adult PKD. (APKD) HIV associated Nephropathy Renal amyloidosis
3> SYMMETRY < 1.5cms	> 1.5cms - assymmetrical Kidneys. Pathology ⇒ always in smaller Kidneys
4> ECHOTEXTURE = (N)	Increased Echogenecity ↓ Active Disease in the Kidney
5> Cortico-Medullary Differentation (CMD)	Most Imp. parameter AKI (Vs) CKI Preserved | Loss
6> COLLECTING SYSTEM - (N)	Obstructive uropathy

GFR ESTIMATION (Functional Status)

Most preferred = Creat. clearance
(Indirect/ surrogate marker)
Easy, cheap, no radiation expo
Cockcroft Gault formulae (Estimated)

$$eGFR = \frac{[140 - Age] \times wt.(kg)}{72 \times S.creat} \quad (\sigma')$$

$- [\ ] \times 0.85 \quad \varphi$

Most Reliable/ Gold std :-
Radio-isotope scan.
(DTPA, MAG-3)
Direct method.
Accurate
Single Kidney GFR
Segmental GFR.
Total Kidney GFR.

Disad
1) Inaccurate (esp in AKI)
2) only - total Kidney GFR

Disad
Invasive
Expensive
Radiation exposure

Uses - MEDICAL
1) Staging of CKI
2) Follow-up - chronic medical Renal Disease
eg. DM, HTN, HIV associated Nephropathy
3) Dose adjustment of Nephrotoxic drug

Uses
- Pre-Transplant assesment of DONOR
- Pre-op assesment of uro Sx
- Mediolegal
- Decision making
  ↳ to operate on better kidney
  never done B/L → risk of infection ↑

R.R.T (Renal Replacement Therapy)

AKI

Def^{n}:- Abrupt decline in GFR over short period of time [271]

KDIGO Guidelines (Kidney disease improving Global outcome - part of National Kidney Found^{n}

Any 1

- ↓ U.O. ≤ 0.5mL/kg/hr ≥ 6hrs. [oliguria].
- ↑ S.Cr. ≥ 0.3 mg/dL from Baseline ≤ 48hrs
- ↑ S.Cr ≥ 1.5x Baseline (50% increase) ≤ 7 days.

Causes of AKI

MC

Pre-renal	Renal		Post-Renal
60-85% - HYPOPERFUSION	INTRINSIC		1-5% - OBSTRUCTIVE UROPATHY
1) Dehydration Diarrhoea Hypoalbuminemia Massive H'ge Burns (Insensitive loses through skin)	95% Tubulo Interstitial Disorders.	5% GN	
2) Hypotension Cardiogenic Septic shock.			
3) Drugs - disrupt autoregulation.			

C/F	PR	Renal	Post-R
	Classical 3 stages	1) Non-oliguric AKI	Loin pain
	Oliguria <400mL/d	eg. SEPSIS	Dysuria
	anuria <100mL/d	(In Tubulo-Interstitial)	Urgency
	Diuretic phase (recovery)	2> Hematuria - GN	

Rarely - Serious UREMIC MANIFESTATIONS

(Cause - mortality in A.K.I.)

1> Encephalopathy / convulsion

2> Pericarditis / shock

3> Coagulopathy

Asis → KDIGO Guidelines.

Approach - AKI

USG - Collecting System → (+) → Post - Renal AKI

↓ (-) → Excludes Post-Renal AKI.

PARAMETER	PRE-RENAL	RENAL
MECHANISMS	RAAS ⊕ ↓ Na^+/H_2O reabsorption ↑↑ urate reabsorption.	Loss of concentrating ability Na+ lost in urine Dilute urine
BUN : Creat	>20:1	<12:1.
U_{Na}	<20mEq	>40mEq
F_{Na^+}	<1%	>2%

U_{osm}	> 500 mosm/L	< 350 mosm/L
CASTS	Hyaline casts	Granular/cellular
USG- Echotexture	(N)	↑ / Bright kidney
Single Best Novel markers of AKI	UNDETECTABLE	DETECTABLE

Rx PALLIATIVE

Indications of Dialysis

1) UREA > 100
2) CREAT > 7
3) SERIOUS UREMIC MANIFESTATIONS
4) Refractory Pulmonary oedema
5) Hyperkalemia > 6.5 mEq
6) Refractory pH < 7.20

Single most Imp. Indication for emergency Dialysis

7) Ingested Dialysable Toxin

(commonly used. Accidental/suicidal)

a) Salicylates
b) Methanol
c) Lithium
d) Polyethylene glycol (solvent)

SPECIFIC

Depends on cause

(A) Post-Renal AKI
Early Sx relief
Excellent recovery

(B) Pre-Renal AKI
Fluid challenge (1st Line)
Inotrophs
Antibiotics
Stop offending drug
Excellent recovery
Delay in Rx → Progress to ATN

(C) RENAL AKI.
↓
Further evaluation.

Stop offending Drug. Supportive Rx
1-2 wks
<1%
Good

GLOMERULONEPHRITIS

Causes :-

Ⓐ PATHOLOGICAL :- Mesangial Involvement on Biopsy

⊕ Proliferative GN

- Mesangio-proliferative GN (IgA, PSGN)
- Crescentric GN (worst prog) (RPGN)
- Membrano-~~capy~~ proliferative GN
  MPGN - mesangio-capillary

⊖ Non-Proliferative GN

- Minimal Change Disease
- FSGN
- Membranous nephropathy

Ⓑ CLINICAL PRESENTATION of GN (More Preferred)

Asymptomatic proteinuria/ microscopic hematuria	Nephritic	Nephrotic	Reno-vascular HTN	C.K.I
MIC	→ Hematuria → HTN → Rapid ↓ GFR. (Risk - RPGN) → Proteinuria <3.5g/day	→ Anasarca (serous cavity) → Hypercoagulable State → Preserved GFR >3.5g/day		eg. Alport's Syndrome

Nephritic	Nephrotic
• PSGN • Lupus nephritis • RPGN	Children → MCD Adults → FSGS Elderly (>50 yrs) → membranous nephropathy
⇓	
Proliferative GN	Non-Proliferative
More likely nephritic	More likely nephrotic

MESANGIO-PROLIFERATIVE

	IgA nephropathy		PSGN
M/c cause	Worldwide		India
Epidemio	20-30 yr, ♂=♀		5-15 yrs. ♂=♀
Etiopath	← Post-infective	M/c	preceded by URTI →
Latent Period	< 1st week Syn-pharyngitic		1-3 weeks ← SKIN 4-6 weeks ←
C/F	Recurrent Gross Hematuria 10-15% - Persistent microscopic	HEMATURIA HTN IUFR → Common	Microscopic hematuria [classical nephritic syndrome].
	Uncommon Benign nature of the disease		
Screening (Serology)	S. IgA-I level ↑↑↑		Anti DNAase (70% cases +) ASO, anti-hyaluronidase
Serum complement	(N)		Initially Low Returns to (N) in 6-8 wks

Biopsy ←	Mesangio-Proliferative changes →	
Immuno flowrescence ←	Granular Pattern of Ig deposits →	
	Anti IgA staining	Anti IgG Staining
Rx	Reassurance Majority - self Limiting Risk of RPGN ≤ 1% Plamapheresis	→ Penicillin - no role in nephropathy To eradicate residual Infec. → Long Term prophylaxis. ⊗ Low relapse rates
Prognosis	BEST among GN	2nd Best (Risk of RPGN-1-5%

POOR PROGNOSTIC FACTORS

1) Elderly onset (> 40yrs)
2) Nephrotic
3) Progression to RPGN — any GN requires RRT ≤ 1 month of onset

LUPUS NEPHRITIS

Kidney involvement - most dreaded.

organ involvement in SLE → H/c/c of acute mortality

Deposition of Anti-ds DNA on GBM. (100% specific)

Type	PATHOLOGY	C/F	Rx
I	Minimal Mesangial proliferation.	Asympt - Proteinuria microscopic Hematuria Preserved GFR	No active Rx
II	Diffuse mesangial proliferation.		

III	Focal nephritis	Classical nephritic syndrome	I.V. methyl prednisolone therapy
IV	Diffuse nephritis	High risk - RPGN (15-20%)	
V	MPGN/membranous	Nephrotic Synd.	oral steroids
VI	Glomerulo-Sclerosis	CKI	Consider RRT

RPGN ⟺ Crescenteric GN

(Clinical Dx) (Biopsy finding)

MPGN

Biopsy Based Δ sis

70% cases → Low C_3 Level

30-50 yrs.

♂ > ♀

90% causes → 2° causes

Causes

1> Infections – Leprosy
Malaria
Syphilis
Hep. B
Hep. C

2> Autoimmune – Type V ~~MPGN~~ Lupus nephritis

3> Solid organ Tumours – [H/c Renal manifestation = MPGN]

4> Lymphoproliferative states

C/F

Majority → "NEPHROTIC SYNDROME"

Δsis

Renal Biopsy – Double BM /
Tram track appearance of GBM.

[Only INTRA-GBM MESANGIAL involvement]
↳ causes splitting of GBM.

10% Idiopathic → R_x - Immunosuppressants

FSGS (Mlc - adults)

- 1° (idio) Mlc Biopsy finding = sclerosing type of FSGS
- 2° Causes (85%) end point of DM, HTN, Reflux induced
  - Most severe collapsing type of FSGS
  - HIV associated nephropathy

C/F - HTN
Early & severe features

Rx underlying disease + strict HTN control

Risk of ESRD: common - slow 15-20 yrs

Acute mortality: No — Favourable Prognosis

MEMBRANOUS NEPHROPATHY (Mc > 50 yrs)

- 1° (idio)
  - EM finding (Gold std) Spike & Dome appearance of GBM
  - NEPHROTIC
  - WORST Hypercoagulable State
  - Hence, max. risk → RV thrombosis
  - Anti-coagulation (all cases) + Immunosuppressants
  - Risk of ESRD: Common - 5-10 yrs
  - Acute mortality: Present (vascular) — WORST PROG.
- 2° Causes: same as in MPGN

C.K.I.

Gradual ↓ GFR ≥ 3 months duration.

Kidneys → Large functional Reserve.

Clinical Disease ≥ 70% Loss of nephrons ≈ 25-40 mL/min eGFR

C/F -

1) UREMIC symptoms (M/c) → M/c neurological feature (90%)

→ Encephalopathy / convulsions
→ Pericarditis / shock
→ Gastritis / Anorexia
→ Infertility / Loss of Libido
→ Proximal myopathy
→ Peripheral neuropathy
→ Restless Leg syndrome
→ Generalised pruritus

Peripheral neuropathy
- (axonal variant)
- Poor recovery inspite dialysis

2) FLUID OVERLOAD symptoms
peri-orbital oedema
peripheral "
CHF

3) Metabolic acidosis

4) ANAEMIA - CKI

5) Renal osteodystrophy

Asu - Done

Rx STAGE of CKI	2 Parameters: Albuminuria	eGFR	Rx
I	Micro albuminuria (Reversible stage)	90 - 120 mL/min	ACEI + strict control of Risk factors (DM, HTN)
II		60 - 89 mL/min	
III	Gross (irreversible stage)	30 - 59 mL/min	Counsel + Prepare for RRT
IV		15 - 29 mL/min	
V ESRD	Gross	< 15 mL/min (> 90% nephron Loss)	RRT is mandatory

Specific Rx - Depends on Cause. → DM, alport, APKD

DIABETIC NEPHROPATHY

Microvascular complication of DM.

Pathophysio → Hyperglycemia (1)

- (2) ↑ Glycated end products → oxidative injury vascular endothelial → HYPOPERFUSION → Microalbuminuria
- GLYCOSURIA = ↑ urine osm → RAAS activation ⊕ (absence of dehydration) → (3) Efferent arteriolar vasoconstrict" → ↑ Glomerular capillary Pressure (already (N)) → Capillary HTN → GLOMERULOSCLEROSIS (F.S.G.S.)
  - (1) ↑ GFR → supra-(N)
  - Gradual nephron Loss
    - (2) Returns to (N)
    - (5) ESKD (> 90% Loss)

Stage	Duration of DM	Alb.	eGFR.	Rx
① Hyper functioning	1-5yrs	⊖	supra-Ⓝ > 120 mL/min. ⇓	Strict DM control ①
② Silent stage	5-8yrs	⊖	Returns to Ⓝ	Adequate Hydration. + ②
③ Incipient (subclinical)	8-12 yrs	Micro albuminuria +ve	CKI stage I/II	ACEI / ARB ③
Early - EM → Thickening of GBM non-specific to Dis				
④ OVERT (symptomatic)	12-18 yrs	Gross	CKI Stage 3/4	Consider RRT
⑤ ESRD	18-25 yrs	Gross	Stage ⑤	RRT is mandatory

LATE/ Advanced/EM → Nodular glomerulosclerosis
irreversible (K-W - Kimmelstiel - Wilson nodules)

ALPORT'S SYNDROME

M/c- XL -Ⓡ defect
20-40 yrs.
♂ > ♀

α_5 subunit - Type IV collagen = ABSENT

H/C ↓ GBM	↓ Cochlear B.M.	↓ Lens		↓ Skin
		H/C ≈ 75%	Most specific	
G.N ↓ Recurrent Hematuria	SNHL	Dot & fleck retinopathy (Not specific)	Ant. Lenticonus (≈ 25% cases)	Asymptomatic

Dx Sig - Renal Biopsy ⇒ "BASKET-WEAVE" appearence of GBM.

only Rx - Renal Transplant
↳ Never recurs in graft
Excellent survival

Post-Transplant Complication - Mimic Recurrence (Hematuria)
↓ ↓
(RARE) → [already on Immunosuppression] Anti-GBM disease (Ab against α_5 subunit).

POLYCYSTIC KIDNEY DISEASE

Group of inherited Disorders characterised by

A) multiple cysts in multiple organs
- Kidney
- Liver
- Pancreas
- Spleen

B) Berry Aneurysm
↑ risk of SAH

C) Colonic Diverticuloses
↓
Recurrent Colitis
↓
↑ oxalate reabsorp" from gut
↓
Hyperoxaluria
↓
Oxalate Renal calculi

Mode of Inheritance

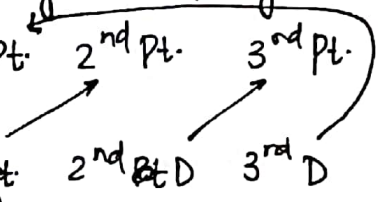
Kidney swapping



HLA Registry

All Sx must be done on same calender

(Limits - chain size)

HAPLO-Identical

(MHC/HLA matching) — 6 Ag matching

Class I	A	B	C
Class II	DP	DQ	DR.

> 3 = good match.

≤ 3 = Poor match.
(Less than half match)

- Most imp. HLA match is HLA-DR
  ↓
  Best success

DIALYSIS

HEMODIALYSIS (H.D.)

- vascular access
  (Cannula, AV fistula)
  High Complications Rates
  (Bleeding, sepsis, Thrombosis)
- H.D. centers
  (Limited availability)
- Biocompatible - methyl cellulose polymer (filter)

PERITONEAL (P.D.)

- Intraperitoneal catheter placement → done ↓ LA
  Low complication rates
  (≤ 1% risk → Peritonitis)
- no problem
  only C/I → Para H/O recurrent GI Sx

Lower cost - omentum acts as filter

• Risk → Infection transmission (HIV, Hep B, Hep C, CMV)	• No Risk → Installing sterile peritoneal Dialysate fluid
• Huge Hemodynamic/osmotic shift → poorly tolerated (M/C) acute comp^{n} → HYPOTENSION – Muscle cramps / Fatigue • Sudden cardiac death In cardiomyopathy EF < 15% ↳ C/I	• LOW SHIFTS → Better Tolerated Safe in cardiomyopathy & Post cardiac Sx
• Risk → HYPOGLYCEMIA Preferred Form. Excellent filteration Rate 800 - 1200 mL/min	Risk → HYPERGLYCEMIA/ Wt. Gain Poor Filteration 15-25 mL/min. only Back-up

DIALYSIS ASSOCIATED AMYLOIDOSIS

- Accumulation of β_2 microglobulin (β_2-MG)
- In the musculoskeletal system
- M/C → entrapment neuropathy
- On dialysis ≈ 3-7yrs
- Neither form (HD/PD) can filter β_2-MG.
- X-Ray Hand - Deposits in metacarpals.
- only R_x = Renal Transplant

PRE-TRANSPLANT - Indications

1) APKD
2) Horse-shoe kid
3) Obstructive uropathy

} ↑ Risk of infections in the native kidneys

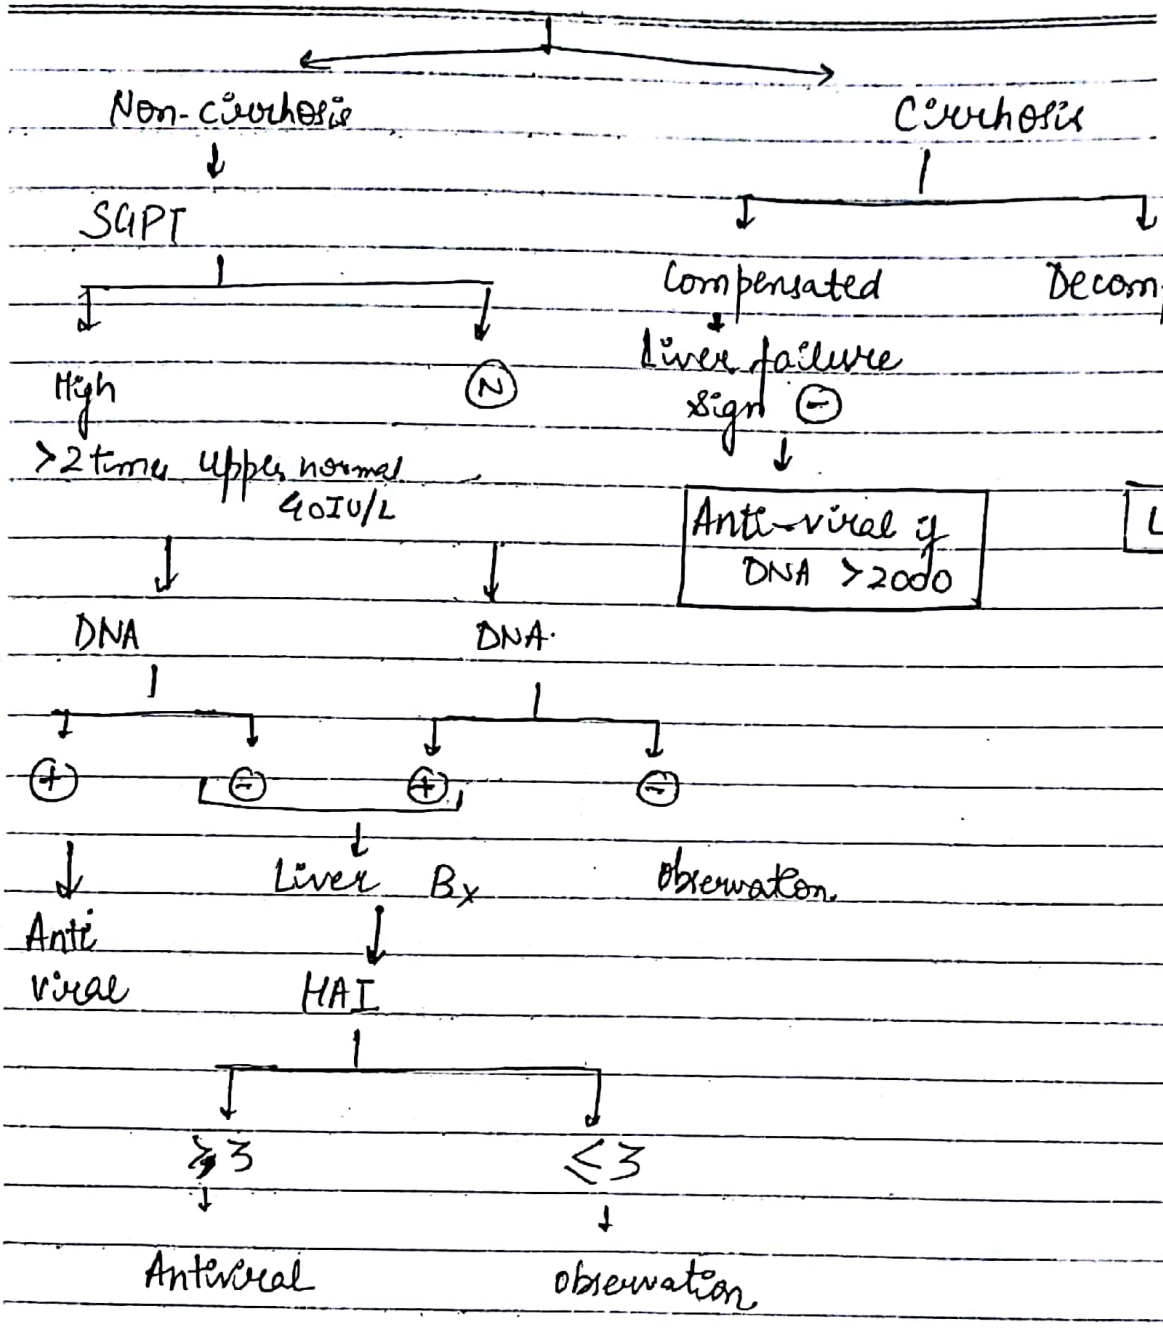
Approach to Chr. Hep B infection

↓



DNA is ⊕ for Anti-viral if ≥20,000 IU/mL. in HBe Ag ⊕

if ≥ 2000 IU/mL in HBeAg ⊖
(Pre-core mutants).

Anti-viral for Hep B

① Initiate ∴ **Monotherapy** from 1st Line agents

1) Interferon α -
- oldest
- Less effective in Cirrhosis

2) Entecavir -
- Most potent
- ↓ effectiveness in lamivudine resistant cases

3) Tenofovir → (DOC)
- Safest + effective even in Lamivudine (R) cases

Duration ≥ 1yr

(II) Chr. Hep. C Infection

Non-Cirrhosis
↓
Start Anti-viral if
1) HCV-RNA detetable
2) Bx - mod-sev hepatitis [HAI > 3]

Cirrhosis (Fibroscan)
- Compensated → Anti-viral
- De-compensated → LT

Antiviral for Hep C

Initiate ∴ (Dual) therapy (oral combination therapy)

INFα → outdated nowadays

Sofosbuvir + Velpatasvir → effective in all 6 genotypes.

>

Sofosbuvir + Daclatasvir

Duration – 12 wks. for all genotypes.

FATTY LIVER

Alcoholic Liver Disease

Patho

Dose → 40-80 g/d = fatty Liver

80 – 160 g/d = cirrhosis

↳ Duration 10-20 yrs

♀ → Dose is half.

Stages — **Mech**

① Fatty Liver ← Ethanol ⊖ → ↓ (N) FA metabolism → ↑ free FA → TG → TG deposit

② Hepatitis ← TNFα

F.L + Enzymes ↑

Non-Alcoholic Liver Disease

Dose of alcohol → 0-20 g/d.

cause – Insulin Resistance

Stages — **Mech**

① Fatty Liver ← TG deposit ← ↑ TG.

Insulin Resistance → Lipolysis → ↑ free FA → ↑ TG.

② Hepatitis ← oxidative injury

③ Cirrhosis ← → ③ Cirrhosis

Stellate cell

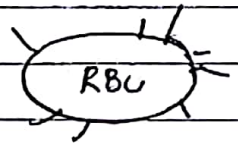
↑

Chr. Hepatitis

C/F

1) Peripheral Neuropathy
   - direct alcohol effect
   - Pure sensory Pyridoxine def. induced by alcohol.

2. Zieve's Syndrome.
Deep Jaundice due to additional effect of haemolysis induced by alcohol



= irregular Acanthocytes

1) Causes of Insulin Resistance
   (1) H/c obesity
   (2) Type 2 DM
   (3) Steroid (⊖ insulin action)
   (4) Hep C

Q. C C/F suggest alcohol as a cause of cirrhosis
- (a) Spider angioma } due ↑ Estrogen → ↓ Catabolism in Liver
- (b) Gynaecomastia }
- (c) Loss of deep tendon reflex
- (d) ascites.

Ix

(1) SGOT / SGPT > 2 Highly specific for ALD
(SGPT synthesis need pyridoxine)

(1) SGOT / SGPT ≤ 1.

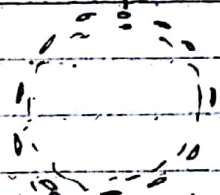
② γGT - ↑ ← (ER) Site = Bile duct + ER Fat Squeeze ER to release γGT.	③ γGT - ↑
③ Peripheral Neutrophilia (+) TNFα recruits if neutrophil > 5500/mm³ = Poor Prognosis	(-)
Rx.	
① Fatty Liver. = Reversible after cessation	FL = Reversible ∵ Rx of underlying cause → obesity
② Hepatitis Doc - Steroid ↓ act on TNFα. Indication if MADDREY's alcoholic discriminant func^n. > 32 = 4.6 x [PT of pt. - PT of control (12sec)] + S. Bil	Vit E. ↓ act as ante-oxidant
③ Cirrhosis Best Rx → Liver Transplant Recurrence of 1° disease after LT = Nil if underlying cause Remain treated	Cirrhosis Liver Transplants

AUTOIMMUNE

Autoimmune Hepatitis	1° Biliary Cirrhosis
Patho	
Direct Ab damage to the hepatocytes. (Type II HS)	Autoimmune fibrosis of intrahepatic Bile duct → Bile accumulation → Damage hepatocytes
C/F ♀	♀
Age 20-40 yrs	40-60 yrs
Recurrent (Recur over years)	Pruritus Xanthelesma (cholesterol deposit in the eyelids)
Inv Ab depends on type of AIH	MC/Most sensitive/Most specific Ab → Anti mitochondrial Ab
I - M/c → ANA Most sensitive Ab → Smooth ms cell P-ANCA	
II → Anti LKM I (Liver kidney microsome) ↓ (also +ve in Hep C infection)	
III - Least common, most severe Ab → Liver soluble antigen Most specific	

Regenerating hepatocytes

Bx



'Rosette pattern'

Non-suppurative inflammation of intrahepatic Bile ducts

Rx

① Hepatitis = Steroids (DOC)

② Cirrhosis

Decompensated → LT

Recurrent after LT → (common upto 50%)

① Compensated cirrhosis
Ursodeoxycholic Acid (UDCA)
(solubilise bile to non toxic)

② Decompensated cirrhosis
LT.

Recurrence after LT → rare

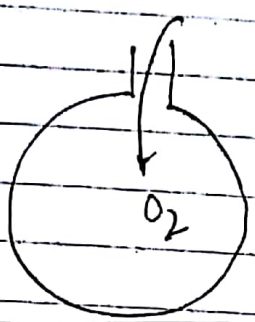
I = Mild Ascites	No clinical signs	salt restriction
II = Moderate "	clinical signs +ve Respiratory distress -	Add Diuretics spironolactone (max - 400mg/day) Furosemide (max - 160 mg/d)
III. Severe	Resp. Distress +	Large vol. paracentesis (5-6L removed) + I.V. albumin (to retain I.V. fluid)

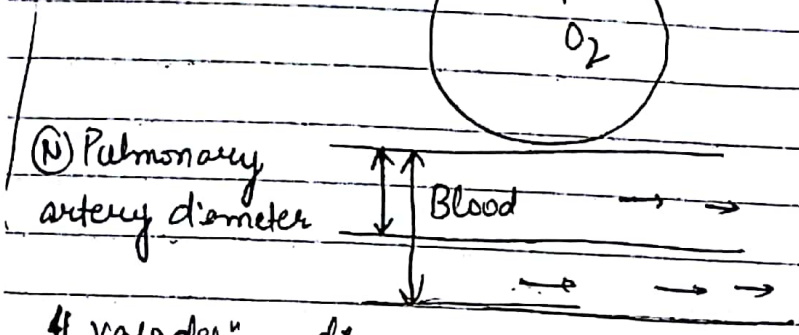
IV Refractory Ascites	No response >7 days of Max dose of Both diuretics	Same as Grade III

⑤ Non-Cirrhotic Portal Fibrosis	⑥ Extra-hepatic Porta vein Occlusion
Age >20 yr	<20 yr.
c/f upper GI bleed + ↑	+
Portal HTN + ↓	+
Spleen + >7cm below Costal margin	+ <7 cm below costal margin
Jaundice ⊖	⊖
Encephalopathy ⊖	⊖
Ascites ⊖	
Rx - Endoscopic Band ligation +	+

3. HEPATO - PULMONARY SYNDROME.

Mech. Pulmonary vasodilatation





↑ vasodil" = diam ↑ occurs

mixing ē deoxygenated blood on Ⓛ side

R to L shunt

C/F

Platypnoea - dyspnea ↑ on standing [diaphragm moves down ↓ shunt open ↓ hypoxia ↑]

Inv

① ↓ in O_2 saturation by 3% on standing from supine
Orthodeoxia

Rx -) Sclerosis of dilated vessel

2) Rx Oc = Liver Transplant

INTESTINAL

MALABSORTION DISEASES

due to SI disease

Proximal	Distal
↑	↑
Fe, FA, Ca, Mg	Bile, Vit B_{12}
Fat, CHo, Protein ++	+

Tests for malabsorption

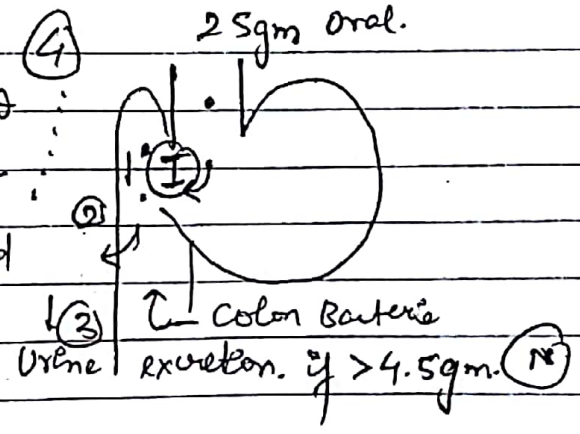
I) For Fat :-

① Gold Std → 72 hour Stool fat estimation.
if fat excretion >6% ⇒ Steatorrhoea
↑
M/C abnormality seen in any malabsorption syndrome

② Spot Ix → Sudan III stain.
+ve if stool fat > 10%

II) For Carbohydrate :-

① Most specific Ix → D xylose Test



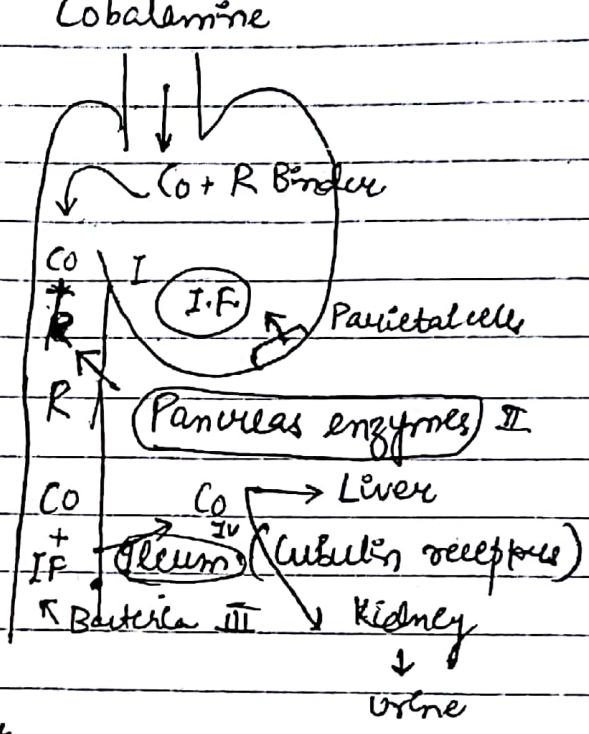
Causes of <4.5gm excretion
1) Pyloric stenosis
2) Proximal SI disease
Eg. Celiac sprue
3) Bacterial overgrowth Syndrome
4) 3rd space Coll → Ascites
Pleural Effusion

⑤ Renal failure

(III) Vit B_{12} malabsorpⁿ:

SCHILLING's TEST

① Oral radiolabelled cobalamine
+
I.M. vit B_{12} (1mg)
to fill Liver
↓
24 hour Urine collection.
↓
↓ <10% → malabsorpⁿ
↓ >10% of excretion → (N) test



If excretion <10% AND becomes >10% after adding.

1) I.F. → Pernicious Anaemia

2) Pancreatic enzyme → Chr. Pancreatitis

3) Ab x 5 days → Bacterial overgrowth syndrome
↓
if remains <10% → Ileum disease

Q. In dietary deficiency of B_{12}, schilling test (N)

Q. Mut' of cubulin (R) ⇒ IMERSLUND GRIESBEECK's SYNDROME

IV Intestinal Biopsy
Gold Std. Ix or Most Specific Ix for malabsorption.

Etiologies of Malabsorption-

CELIAC SPRUE	TROPICAL SPRUE.
Cause GLIADIN Hypersensitivity (+ve in gluten) ↓ Local contact HS	Bacterial Toxins. + Folic acid deficiency (↓ mucosal repair)
Prox SI > Distal SI	Distal SI > Prox SI.
G/F * Age- Typical 6-12 months can occur at any age Spontaneous remission - 2nd decade	Adults
* Steatorrhoea (large vol, foul smelling) leading to ↓ Chronic >4 weeks. Non-inflammatory (No blood or pus in stool)	✓
* Extra-intestinal manifestation. M/c- Dermatitis Herpetiformis Other - T1DM, IgA deficiency	

	COELIAC SPRUE	TROPICAL SPRUE
Inv		
① Serology	+	−
Most specific Ab = Anti-Endomysial Ab.		
Most sensitive Ab = Anti tissue Transglutaminase (TTG)		
Most sensitive + specific Ab/MC/Best = Anti TTG		
② Biopsy		
• Loss of villi	+ (reversible after gluten free diet)	+
• Flat mucosa	+	+
• Lymphocyte infiltration	+	+
③ HLA DQ2	(+) in 100% cases.	−
HLA DQ8	but non-specific	−
Rx		
1. Gluten free diet		Antibiotics → Doxycycline or Rifaximin. + Folic acid. Duration of Rx → 6 months
2. Steroid. Indications		
1) Refractory sprue		
2) (no response upto 12 months) of gluten free diet		
2) Celiac shock (↑ gluten load)		
3) SI Lymphoma		
M/c cause of death		

WHIPPLE'S DISEASE

~~Ato~~ Cause - Tropheryma Whipelii

C/F

Acute	OR	Chronic (HS reaction)
1) Acute GE		1) Mc presentation = migratory Poly/oligo arthritis
2) Pneumonia		

2) CNS
M/c → Dementia
Most characteristic CNS manifestation
Oculo Masticatory Myorhythmia
(conv./diverg. nystagmus.)

Other CNS manifestation.
- Cerebellar ataxia
- Myoclonic seizure
- Encephalopathy
- P. Neuropathy

3) CVS - Pancarditis
M/c - Pericarditis.

4) Eye - Uveitis

5) Polyserositis = Ascites
Pleuritis

Q. organ not involved in whipple's
① ~~kidney~~
② Lung
③ CVS
④ CNS

Inv Bx - PAS +ve macrophage containing

D/D → TB

Bacilli	TB
AFB ⊖	AFB ⊕

Rx ① GIT → Ceftriaxone (2wk) → Cotrimoxazole (1yr)

② CNS/CVS → Ceftriaxone (2wk) → Doxycycline + Chloroquine or Hydroxychloroquine (1 year)
(↑ risk of recurrence)

BACTERIAL Overgrowth Syndrome

Proliferation of colonic bacteria in prox SI

Causes -

Communication bet" LI & SI	Anatomical stenosis of SI	Functional Stenosis of SI
↑	↑	(↓ Peristalsis)
fistula	stricture	↑
	+ Intussepteon	DM
		systemic sclerosis

CF -

1) Steatorrhoea — Bile is deconjugated by bacteria in S.I.

Inv.

1) 72 hour stool test. >6%

2) D-Xylose Test
excretion <4.5 gm

3) Schilling Test ab (N)

4) S. Folic acid level ↑ (Synthesis by bacteria + reabsorbed by Prox. SI mucosa).

5) Lactulose Breath test or H^+ Breath test.
↓
+ve in Breath 2-8 hour after giving lactulose as Bacteria in SI metabolise.

6) Endoscopic jejunal aspirate culture
↓
M/c organism E.coli $>10^5$/mL

Rx

1) T/t underlying cause

2) Cyclic ~~Ab~~. antibiotics [Co-amoxyclav.
Ab x 1 week
↓
gap 3 wk.
↓
Ab 1 wk

APPROACH TO DIARRHOEA

Essential Criteria for Diarrhoea
Stool vol. > 200 mg/d
Stool wt. > 200 mg/d

Duration.

Types

< 2 wk	2-4 wk	> 4 wk
Acute	Persistent	Chronic
90% Due to infections Acute & Persistent		≥ 90% due to non-infectious

If Infectious Diarrhoea

	Toxin induced (↑electrolyte + H_2O secretion)	Inflammation induced (exudative
• Fever	⊖	⊕
• Pus in stool	⊖	⊕
• Blood in stool	⊖	⊕

If Toxin induced

Preformed	Enterotoxin
I.P. ~ in hours	1-2 days
1) Bacillus cereus (Chinese Restaurant diarrhoea	1) Vibrio cholerae (↑ HCO_3 in stool - Rice ~~stool~~ watery stool

2) Staph. aureus.

2) Enterotoxic E.Coli
M/c c of Traveller's diarrhoea

3) Clostridium Perfringes

If inflammation induced

I. Mild = mucosa limited. (blood in stool ⊖)

II. M/c Viral diarrhoea in adults = Noro virus
" " " children = Rota virus

II Mod. = submucosa

1) Salmonella → involves ileum
↓
Bile reabsorpⁿ ↓
↓
Bile in stool.

III Severe

2) Yersinia → Severe ileum inflammation
Pseudo appendicitis

(3)
II Campylobacter J. M/c infectious cause of GBS

III Severe = Deep layers

1) Shigella → Toxic encephalopathy
Ekiri Syndrome

2) E. histolytica → flask shaped ulcer

Rx - acute/persistent diarrhoea

① Essential - Rehydration

I.v. fluid of choice → RL contains

	mmol/L
K+	4
Na^+	130
Ca^{2+}	2
Cl^-	109
Lactate$^-$	28
Osmolarity	273

slightly hyposmolar

② Antibiotics

Indication - Mod to severe inflammatory infectious diarrhoea

If ≥ 1 of 3 criteria (+)

a) Fever >101°F

b) Blood in stool

c) Pus in stool

Empirical = Flouro quinolones.

Chronic Diarrhoea

↓ Non-inflammatory
eg. Malabsorption Syndrome

↓ Inflammatory
LMR
Topic
Ulcerative colitis } IBD
Crohn's Disease

	UC	CD
*Risk/associated		
① Smoking	↓	↑
② appendicectomy	↓	↑
③ Drugs		
OCP	↔	↑↑
Methyldopa	↑	↔
Ab use in 1year	↑	↔
④ Infections	↔	↑ MC = Mycobacterium Para TB.
		Infection & MC of CD - H. Pylori
⑤ Turner's	↑	↑ NOT DOWN SYNDROME
⑥ IL-10 Receptor deficiency	↑	↑
↓		
ⓝ anti-inflammatory		
→ Early onset IBD.		
C/F Intestinal		
M/c site →	Rectum + Sigmoid > Rectum only	M/c site → SI + LI > SI only.
		M/c isolated site - Ileum.
M/c isolated site - Rectum		Rectum is usually spared
Site not involved → SI.		

① Malabsorption Synd	⊖	⊕
② Bleeding PR (Tenesmus)	⊕	⊖
③ Fistula formation	⊖	⊕ (Transmural involvement)
④ Toxic Megacolon (dilatation of colon >6cm)	⊕	⊖ Bowel wall or thick resist dilatation
Ulcer → Collar Button ulcer (non-creeping)		Cobblestone ulcer (Creeping)
Inv		
① Stool Examn. Lactoferrin correlate ī disease activity	⊕	⊕
Calprotectin Predicts ~~relapse~~ relapse	⊕	⊕
② Serology. M/c → ANCA		Mc Anti Saccromyces cerevisce Ab
Role → ↑ risk of Pancolitis		Role - ↑ risk of early complication
③ Confirm	Bx	Bx

Rx of Ulcerative Colitis

(I) Mild to mod. severity (stool freq. < 6/day)

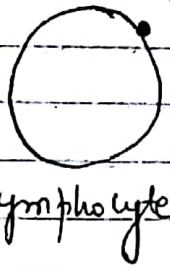
- Distal Dis
  - DOC.- Per Rectal ASA
  - Mesalamine
- Pancolitis
  - DOC - Oral ASA
  - Mesalamine + Sulfasalazine
  - ↓ If no response in 4 wks.
  - Oral steroid therapy

II Severe IBD (Stool frequency > 6/day or shock).

DOC - I.V. Steroid

- Steroid response
  - ↓ Taper + Stop
- ~~Taper + Stop steroid~~ Steroid Dependent
  - ↓ Steroid sparing agent
  - Azathioprine
- Steroid resistant (no response in 5 day)
  - ↓ TNF α Ab or cyclosporine
  - ↓ if unresponsive
  - only for CD - Anti - Integrin

Only in Crohn's Disease (Resistant steroid)



Integrin (N) helps in vascular adhesion

β_1 ↙ ↘ β_7 subunit

Lymphocyte ↓ specific for GIT vessels

Ab against β_1 & β_7 = NATALIZUMAB.
(used in Multiple Sclerosis)

↓

S/E → Reactivate JC virus

↓

Progressive multifocal leuko encephalopathy

Ab against β_7 = VEDOLIZUMAB

Rx of Crohn's Disease

I. Mild to Mod. IBD

↓ ↓

Ileum limited

DOC - Ileal Release Budesonide

Small + Large Intestine

DOC - Oral prednisolone

↓ no response in 4wks

Methotrexate.

* Miscellaneous Points :-

1) MC cause of death → Cancer

2) Colonic cancer risk → Ulcerative colitis = Crohn's Disease

3) Colonic Ca risk ↓ → Folic acid, ASA agents.

4) Extraintestinal Manifestation of IBD (usually more in CD)

Correlated with Bowel activity	Independent of Bowel activity
Skin - ① Erythema Nodosum (Red, hot, tender, nodules on shin)	N - neutrophil infiltration N - non-infective N - necrosis of skin, ① Pyoderma Gangrenosum
Joints - Migratory Polyarthritis (Peripheral joints)	Ankylosing spondylitis
Eye - Episcleritis	Uveitis
Liver - Non-alcoholic fatty Liver Disease	1° Sclerosing Cholangitis → Risk factor for Cholangio Carcinoma

Q. M/c extra-intestinal organ affected in IBD - Joints

Q. M/c " " manifestation. → Erythema Nodosum

Q. C " " " more in UC → Pyoderma
1° sclerosing cholangitis

Addition Harrison selected.

Part I → Involuntary wt. loss – Defn
Causes
Inv (Table)

Ascites

Table of causes of diarrhoea

Part II – Table of T/t of Hepatitis C
(exclude doses or regimen)
